Order Flow Blueprint: Momentum & Reversal Course

Module 1 – Order Flow Out Of Chaos

Disclaimer

This course is for educational and informational purposes only and should not be considered a solicitation to buy or sell a futures contract or make any other type of investment decision. Futures trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing ones financial security or life style. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

CFTC Rules 4.41 - Hypothetical or Simulated performance results have certain limitations, unlike an actual performance record, simulated results do not represent actual trading. Also, since the trades have not been executed, the results may have under-or-over compensated for the impact, if any, of certain market factors, such as lack of liquidity. Simulated trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve profit or losses similar to those shown.

Welcome to the Order Flow Blueprint Momentum & Reversal Course!

The reason I made this course is to put an end to 95% of aspiring traders getting hopelessly lost along their trading journey.

This course is designed to teach advanced order flow to both beginners and advanced traders.

You will learn how to analyze market order flow on a scale never before seen by retail.

Traders new to order flow are put off to the footprint because they think there is just too much going on. That is because they don't know what they are looking at, which is basically volume and how it trades. Not only do you want to watch how large volume is transacting in the market, but also areas of lack of volume.

That is the drawback of looking at a bookmap or heatmap is that traders are focused mostly on areas of heavy volume, not lack of volume. The footprint helps you see that lack of volume much more clearly. Order flow allows you to see what’s been done and how it’s being done at price.

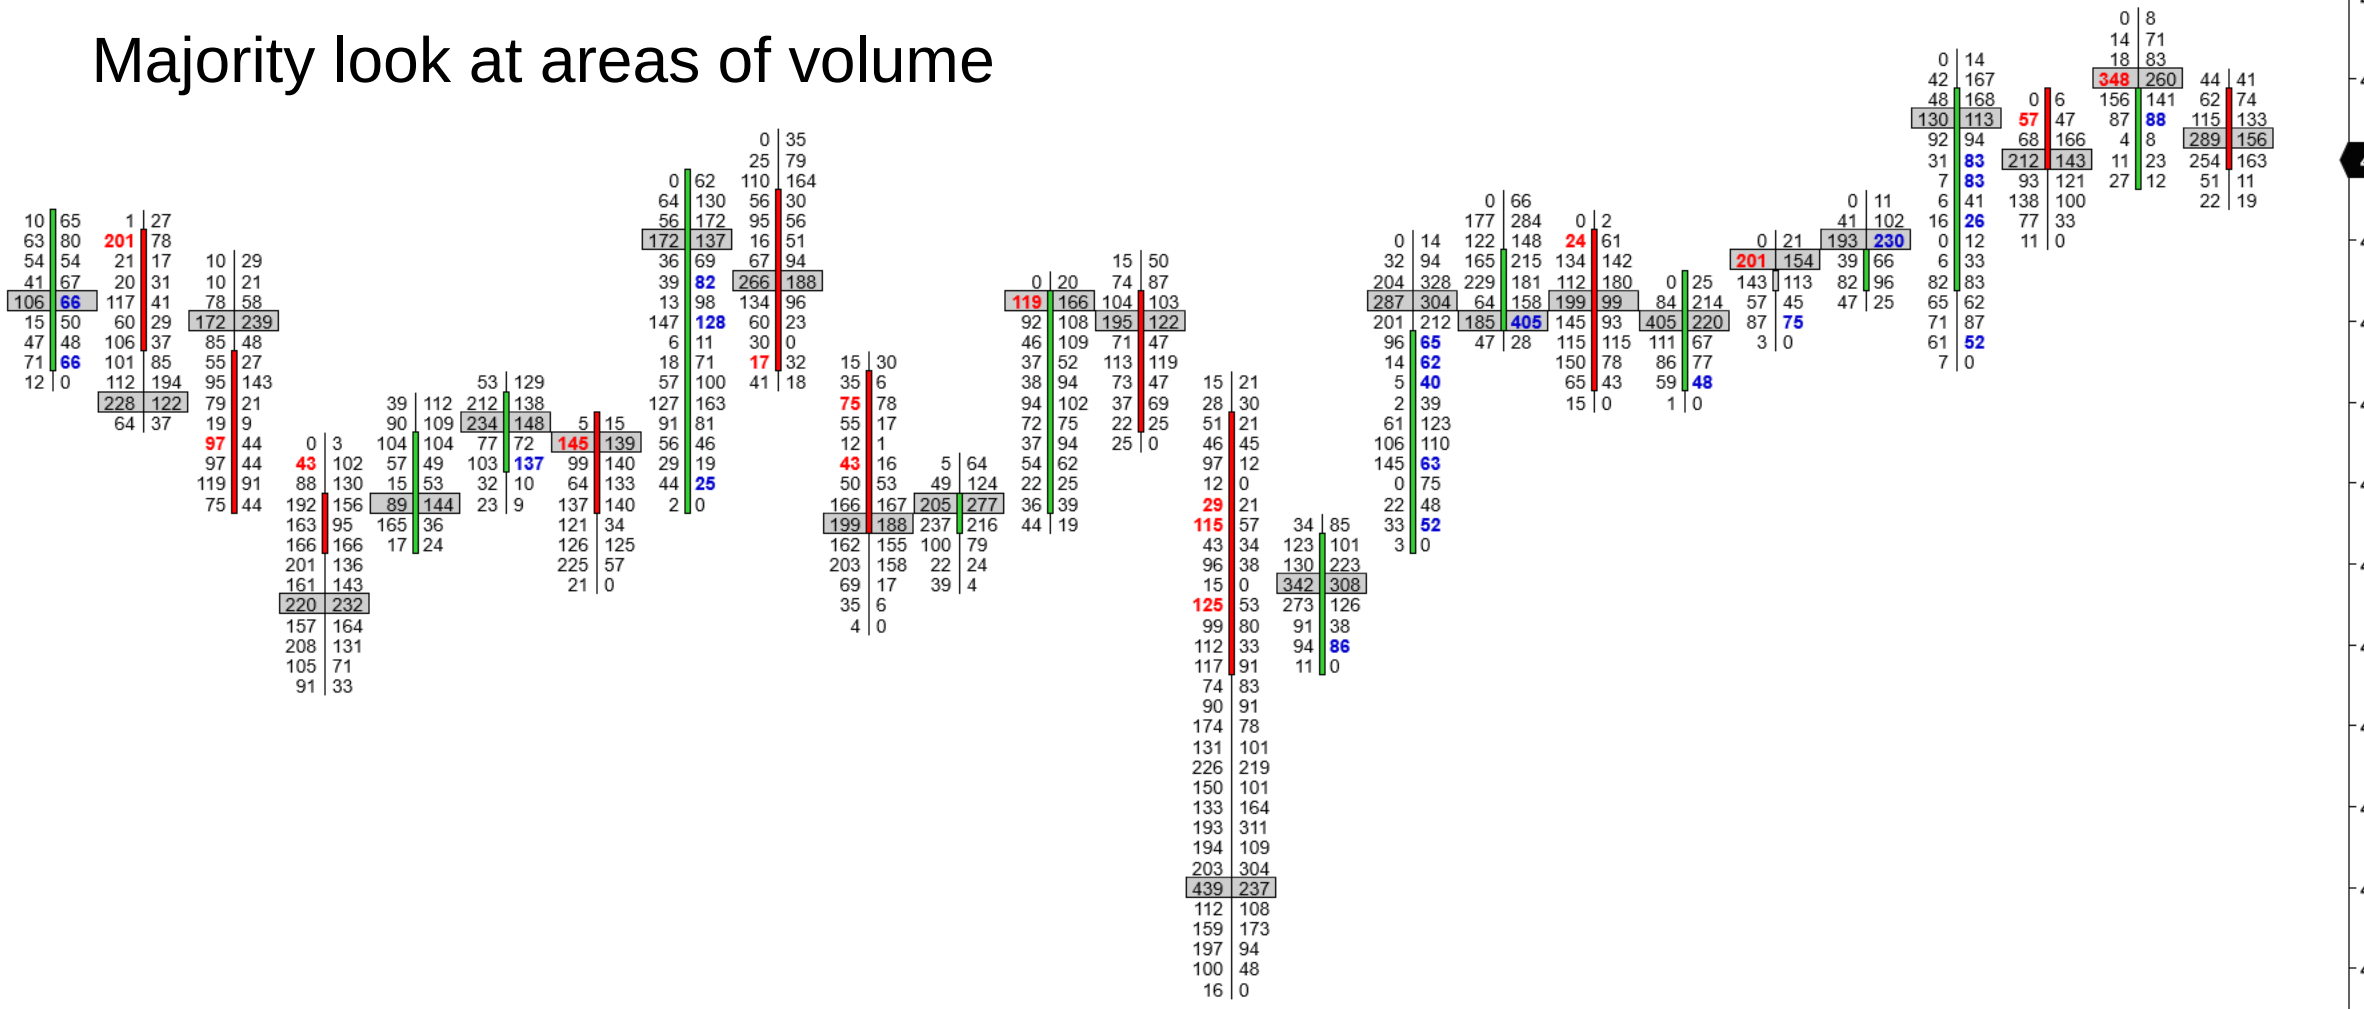

How volume (both big and small) is trading at different prices. What other traders consider noise is critically important to order flow traders.

A problem many traders have is trying to make sense of a market that is acting illogically. What I mean is when markets move opposite in the face of positive or negative economic data. They mistakenly think all good news creates moves up and all negative news creates moves down. We know this isn't the case.

Everyone has their own opinion of where a market should be valued at. Traders simply want an easy explanation for what happened and unfortunately, they accept any reasonable explanation for why a market moved. Then the next time the same thing happens, they expect the market to act the same way. Until a trader starts to understand for himself what makes a market move, the actual buying and selling, they will never be able to progress.

All directional price movement is the result of an imbalance between traders who believe price is going up and traders who think price is going down. But there in lies the problem...we never absolutely know where prices will go.

For every buyer, there is a seller. Another way to look at it is for every loser there is a winner. When someone loses, there is a chance for you to make money if you are trading against them and they realize they are wrong and exit their trade at a loss.

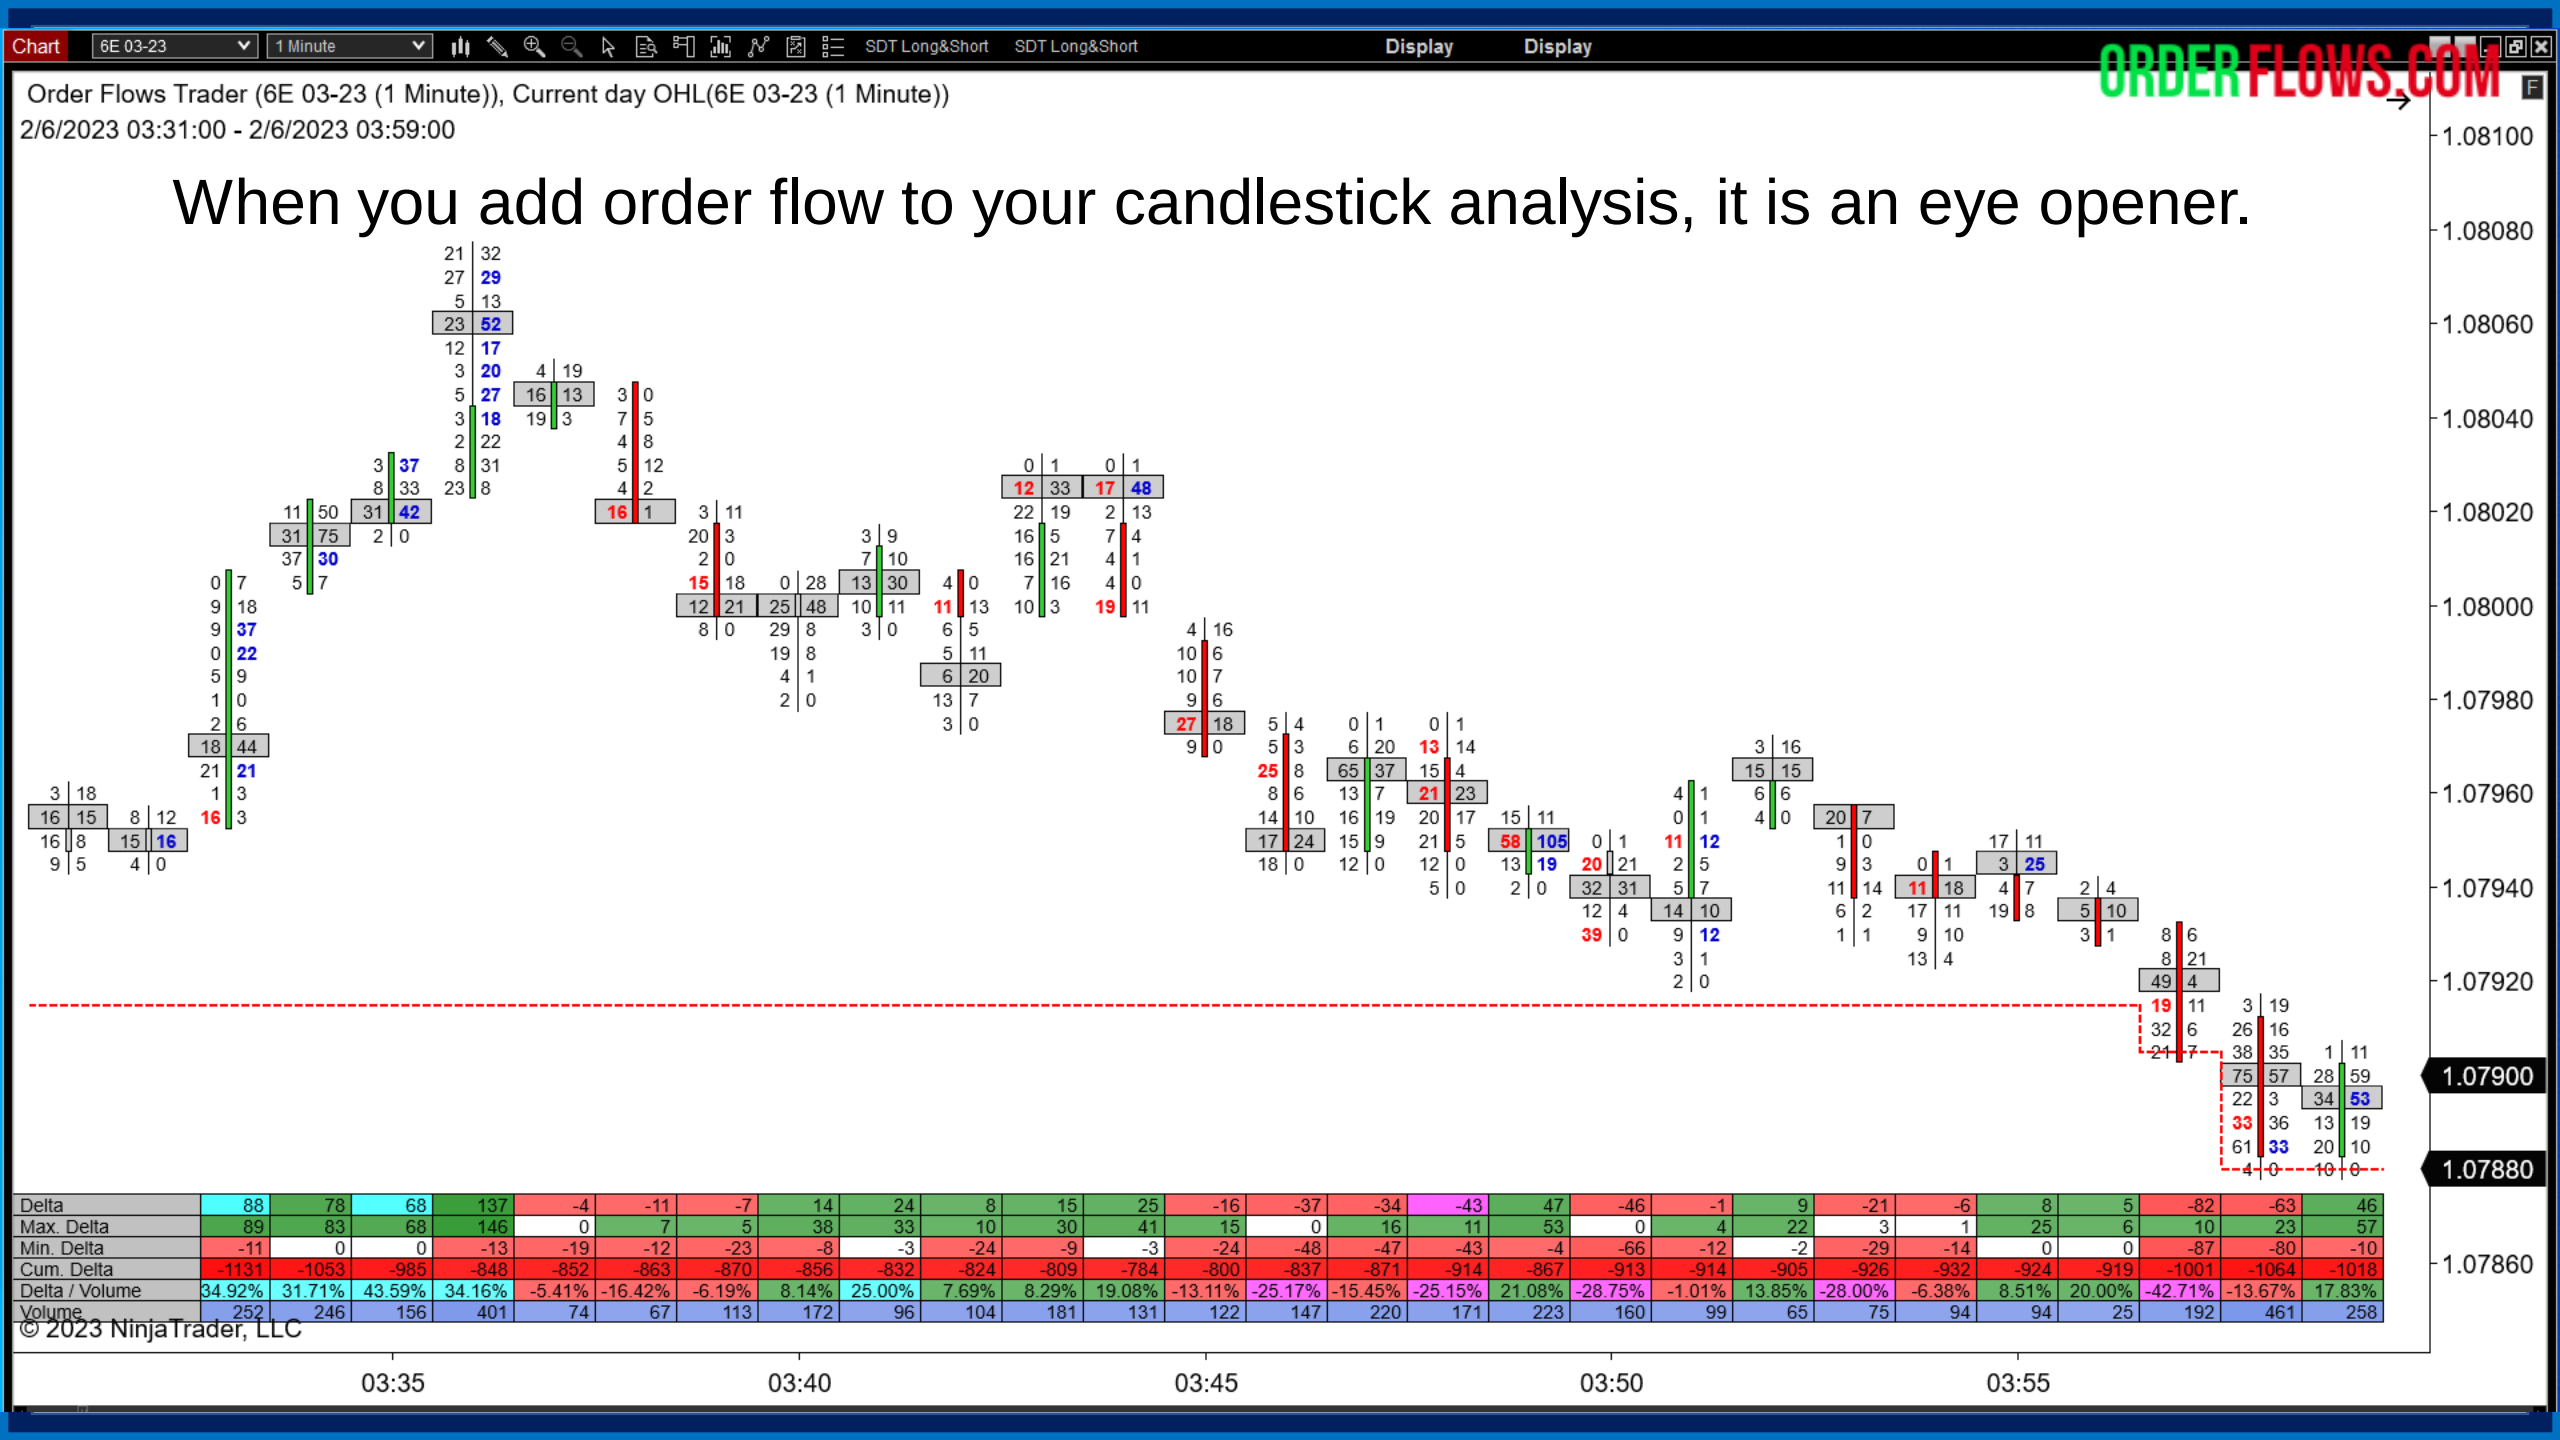

If you can determine where other traders are potentially making or taking losses. What if you can find those traders? Traders who are trading against the flow of the market are taking low-probability trades. If the market is starting to show weakness in the direction of their trade (ie market going against them), they will start to worry and stress out. When the market finally starts to show signs of that it is not going to move in the direction of their trade, they get out (exit) their losing trades.

Candlesticks have 4 parts - open, high, low and close. Yet it seems many traders put the most importance on the close. It is the close that determines the type of candle you are analyzing. The close is the most recent piece of data.

How order flow acts against the close of a bar is important in determining the movement of the market.

Order flow is not an indicator at all. It is simply the market, it is data. But from order flow data you can start to create indicators or tools based on the data.

Order flow is not a leading indicator. A leading indicator is one that tells you ahead of time where the market is likely to stop and turn.

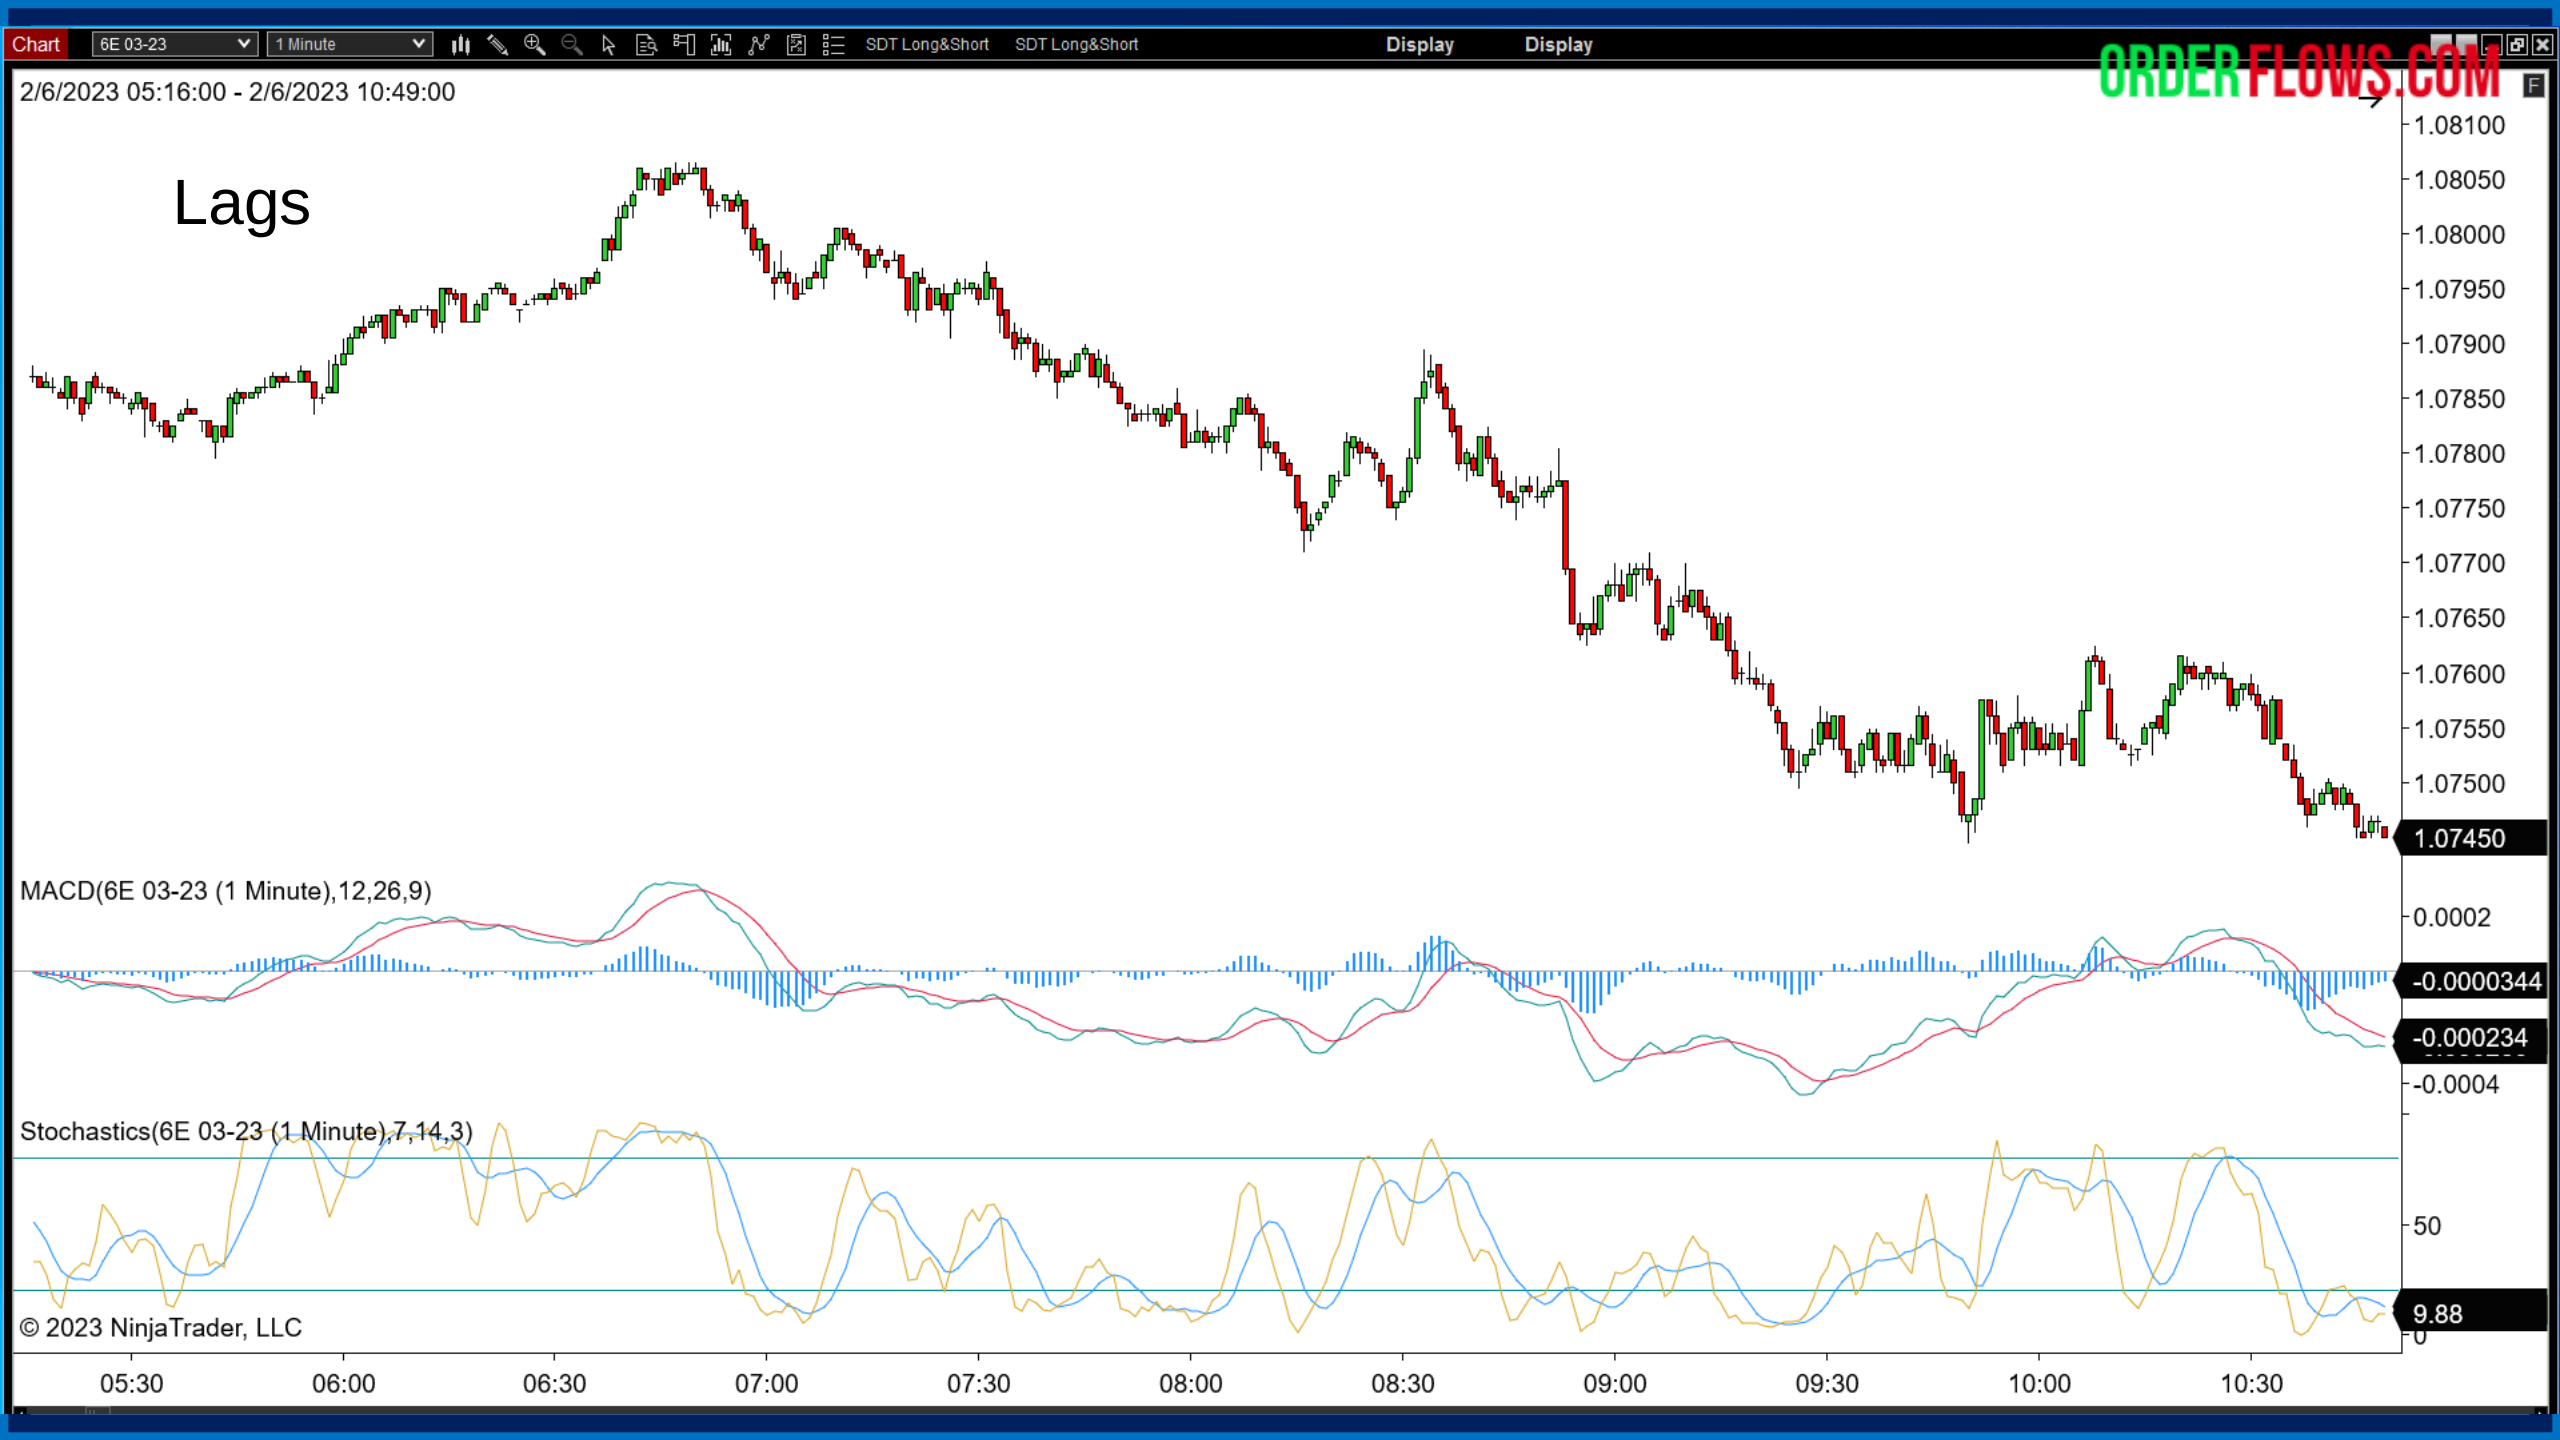

Retail traders think that they can look into the minds of institutional traders by using technical analysis or price based indicators. What retail traders don't understand is that institutional order flow is created from future fundamentals and risk management.

Do you really think a simple indicator can reveal what sophisticated hedge funds or institutional traders are doing?

Coincidental indicators are indicators that don't give useful information ahead of time. They may indicate when a market is trading up at support or down at resistance, like an oscillator, but they don't tell you that ahead of time to be called a leading indicator. Overbought/Oversold, MACD, Stochastics.

Lagging indicators wait for a move in price, then later give a signal to buy or sell based on that price movement. They lag behind current market activity. The signals are generated well after the fact.

It is human nature to prefer lagging indicators because there is a certain comfort level in watching a market already moving in the direction of the signal. The problem how much further can the move go. How lagging is the indicator?

If you are using a lagging indicator to determine a trend, by the time the indicator reveals a trend, the trend is well underway and everyone else notices it. Maybe you get in and get a little bit out of the trend. But then, opposing trade comes in and the market retraces stopping out traders using lagging indicators because they got in late.

Many traders try to confirm their analysis with combining indicators for confirmation. However, their problem is they use indicators that are similiar in nature or parameters which are highluy correlated. For example, using a 21 EMA together with a Bollinger Band that is based on a 20 day simple moving average.

The Bottom Up Method

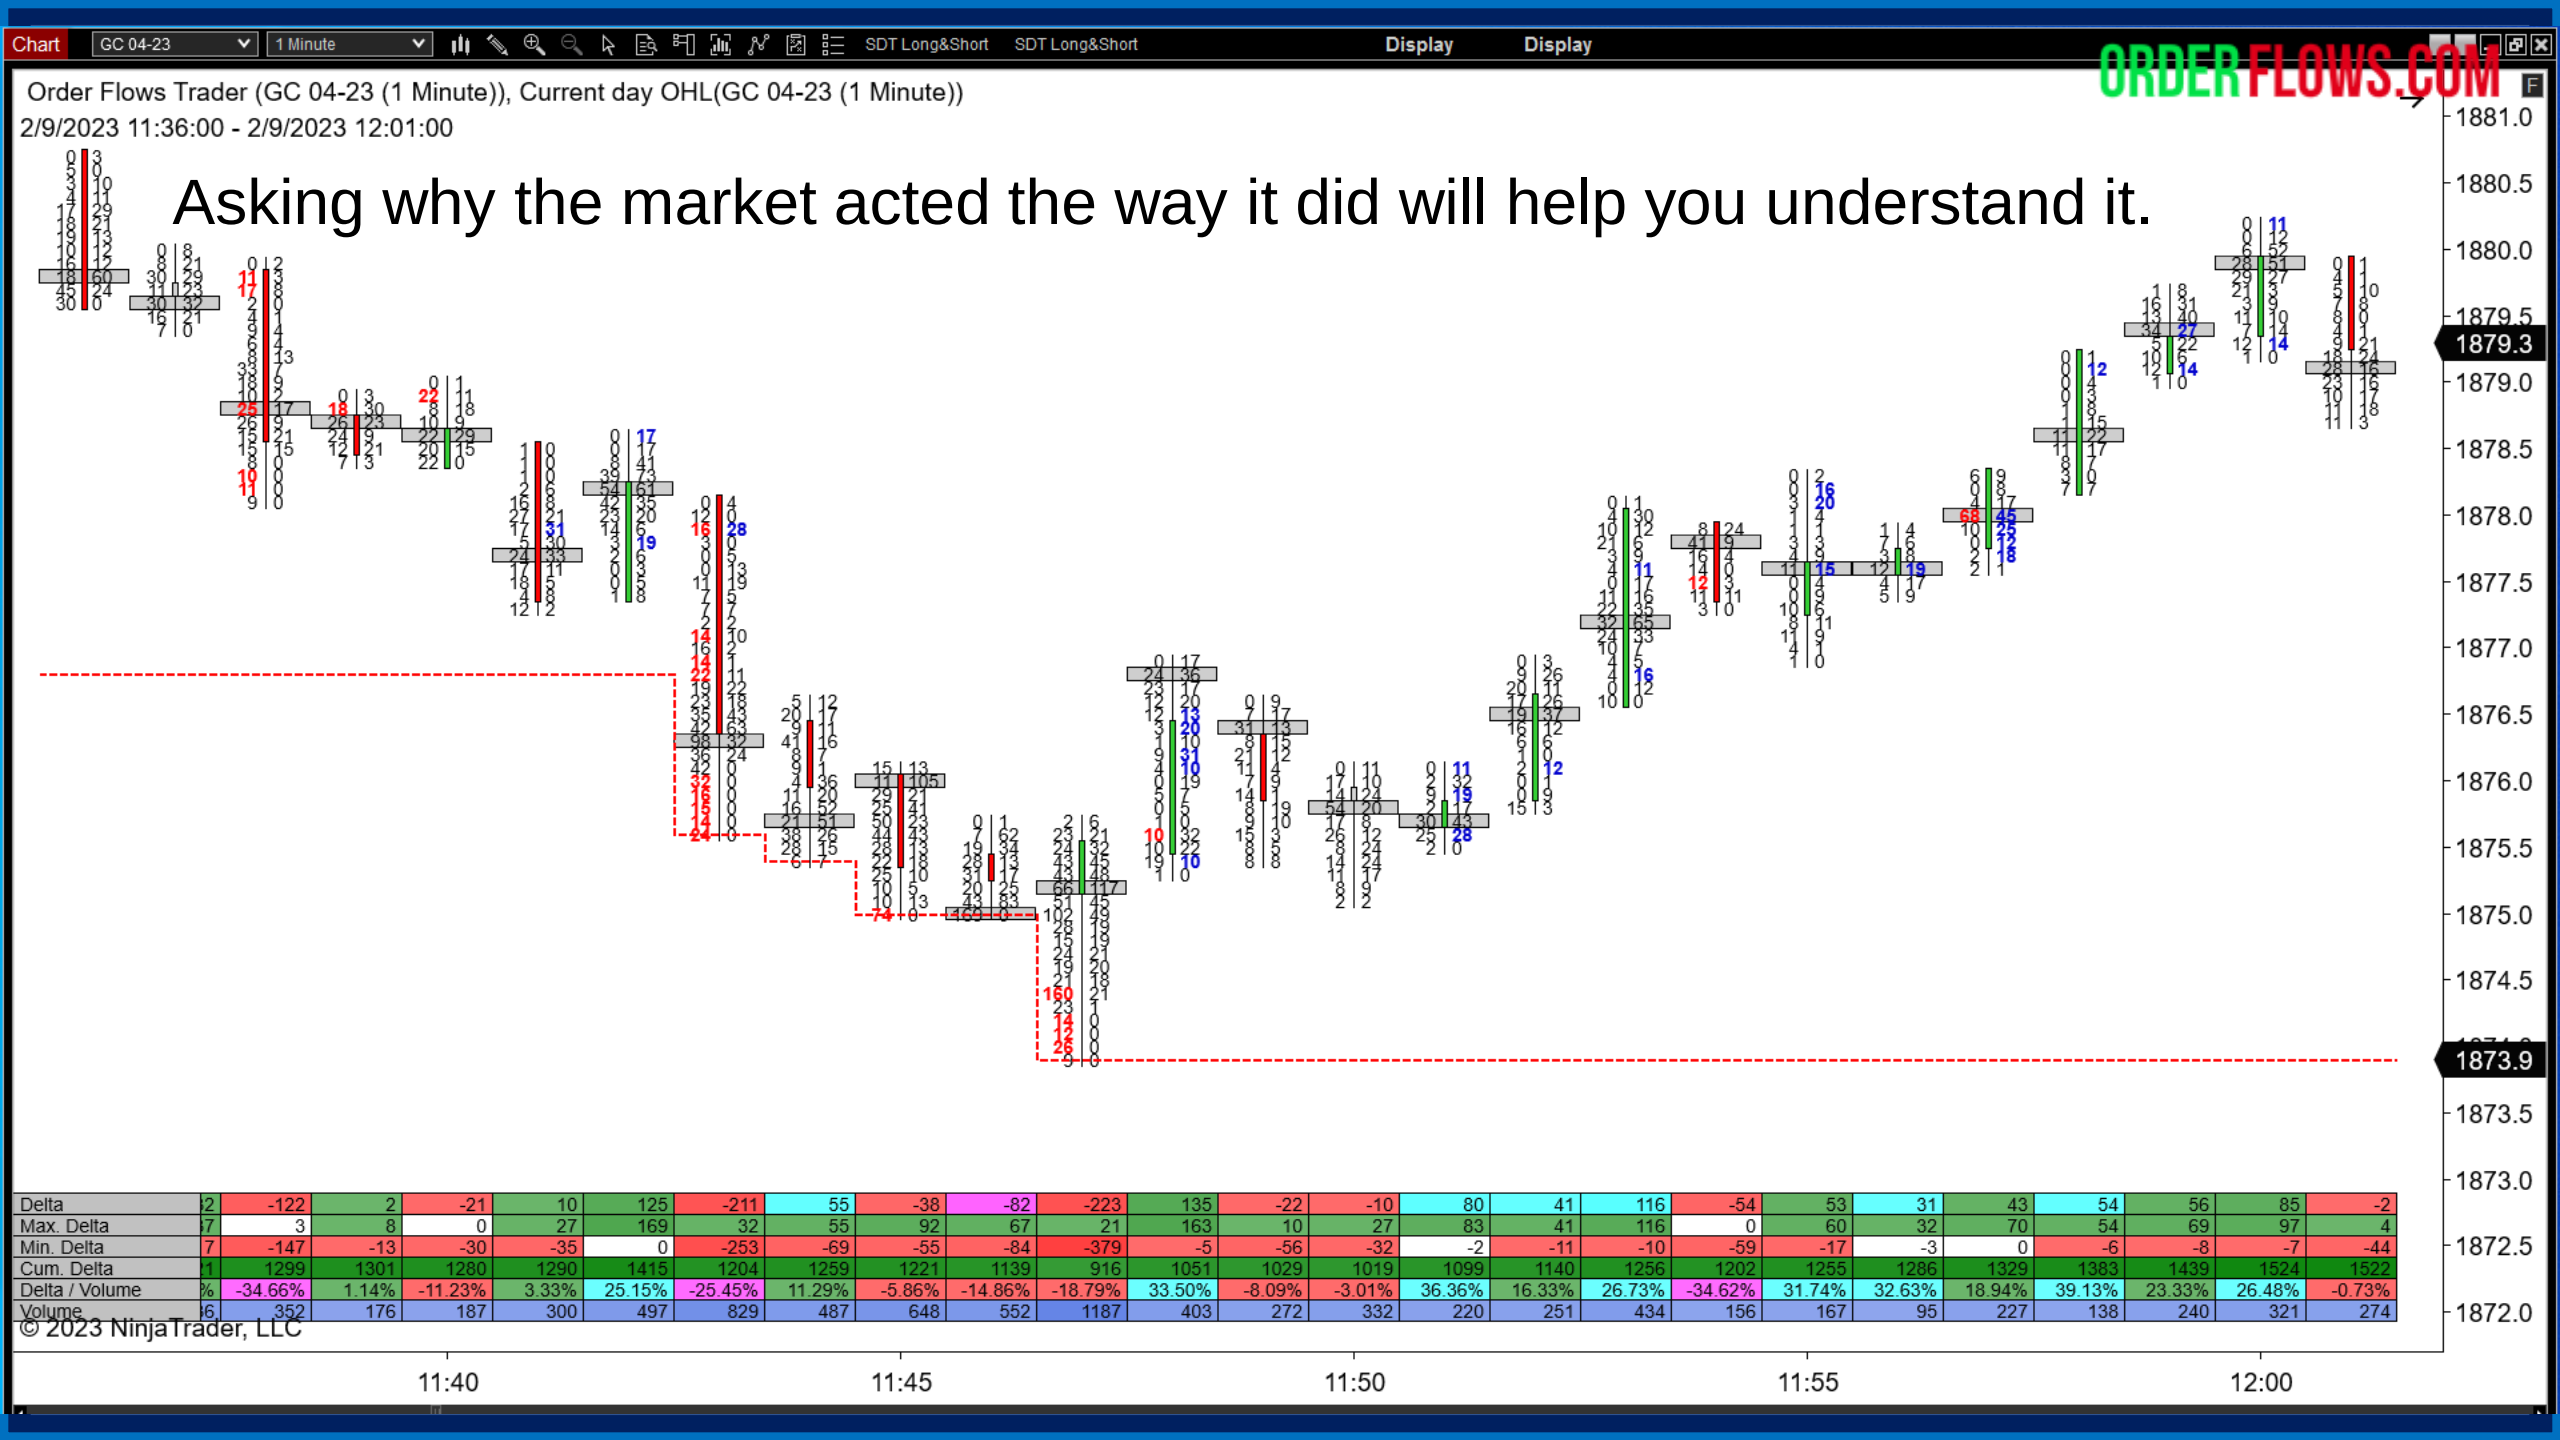

The bottom-up method is all about starting with the most basic individual concepts and working your way up while identifying the critical elements that make each of the situations ahead unique and knowing which factors to consider in each one. My goal is to turn your brain into an order flow processing computer that efficiently considers only those factors of order flow most relevant to current market conditions.

The law of flotation was not discovered by contemplating the sinking of things, but by contemplating the floating of things which floated naturally, and then intelligently asking why the did so." - Thomas Troward

Once a trader is able to trade based on the buying and selling taking place in the market instead of outside factors, it is an epiphany. The market doesn't care what you opinion is and it surely doesn't care what your opinion is. The market moves regardless. The market doesn't care if you make a profit or loss on a trade. Your trading ability dwells in you. In your ability to make sense out of all the nonsense taking place.

You may not realize it, but how you approach learning order flow is one of the biggest factors in determining your trading success.

Instead of being stuck spinning your wheels going nowhere you can motivate yourself and become more excited to becoming the best trader you can be.

ORDERFLOWS.COM

This concludes Module 1.

I will see you in the next module.
