Strategic Order Flow Trading

Module 2 Enhancing Your Order Flow Trading Performance

Disclaimer

This course is for educational and informational purposes only and should not be considered a solicitation to buy or sell a futures contract or make any other type of investment decision. Futures trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing ones financial security or life style. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

CFTC Rules 4.41 - Hypothetical or Simulated performance results have certain limitations, unlike an actual performance record, simulated results do not represent actual trading. Also, since the trades have not been executed, the results may have under-or-over compensated for the impact, if any, of certain market factors, such as lack of liquidity. Simulated trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve profit or losses similar to those shown.

A footprint is a tool that fits within the spectrum of trading tools. I would compare it to technological advancements, highlighting how tools evolve to become more efficient and effective. The footprint tool, alongside other tools like book maps and price ladders, represents the latest advancements in trading technology.

Setting up a footprint chart requires customization based on individual trading strategies and preferences. Here are some key considerations:

Timeframes: Choose the timeframe that aligns with your trading strategy. Shorter timeframes provide more detailed information, while longer timeframes offer a broader perspective.

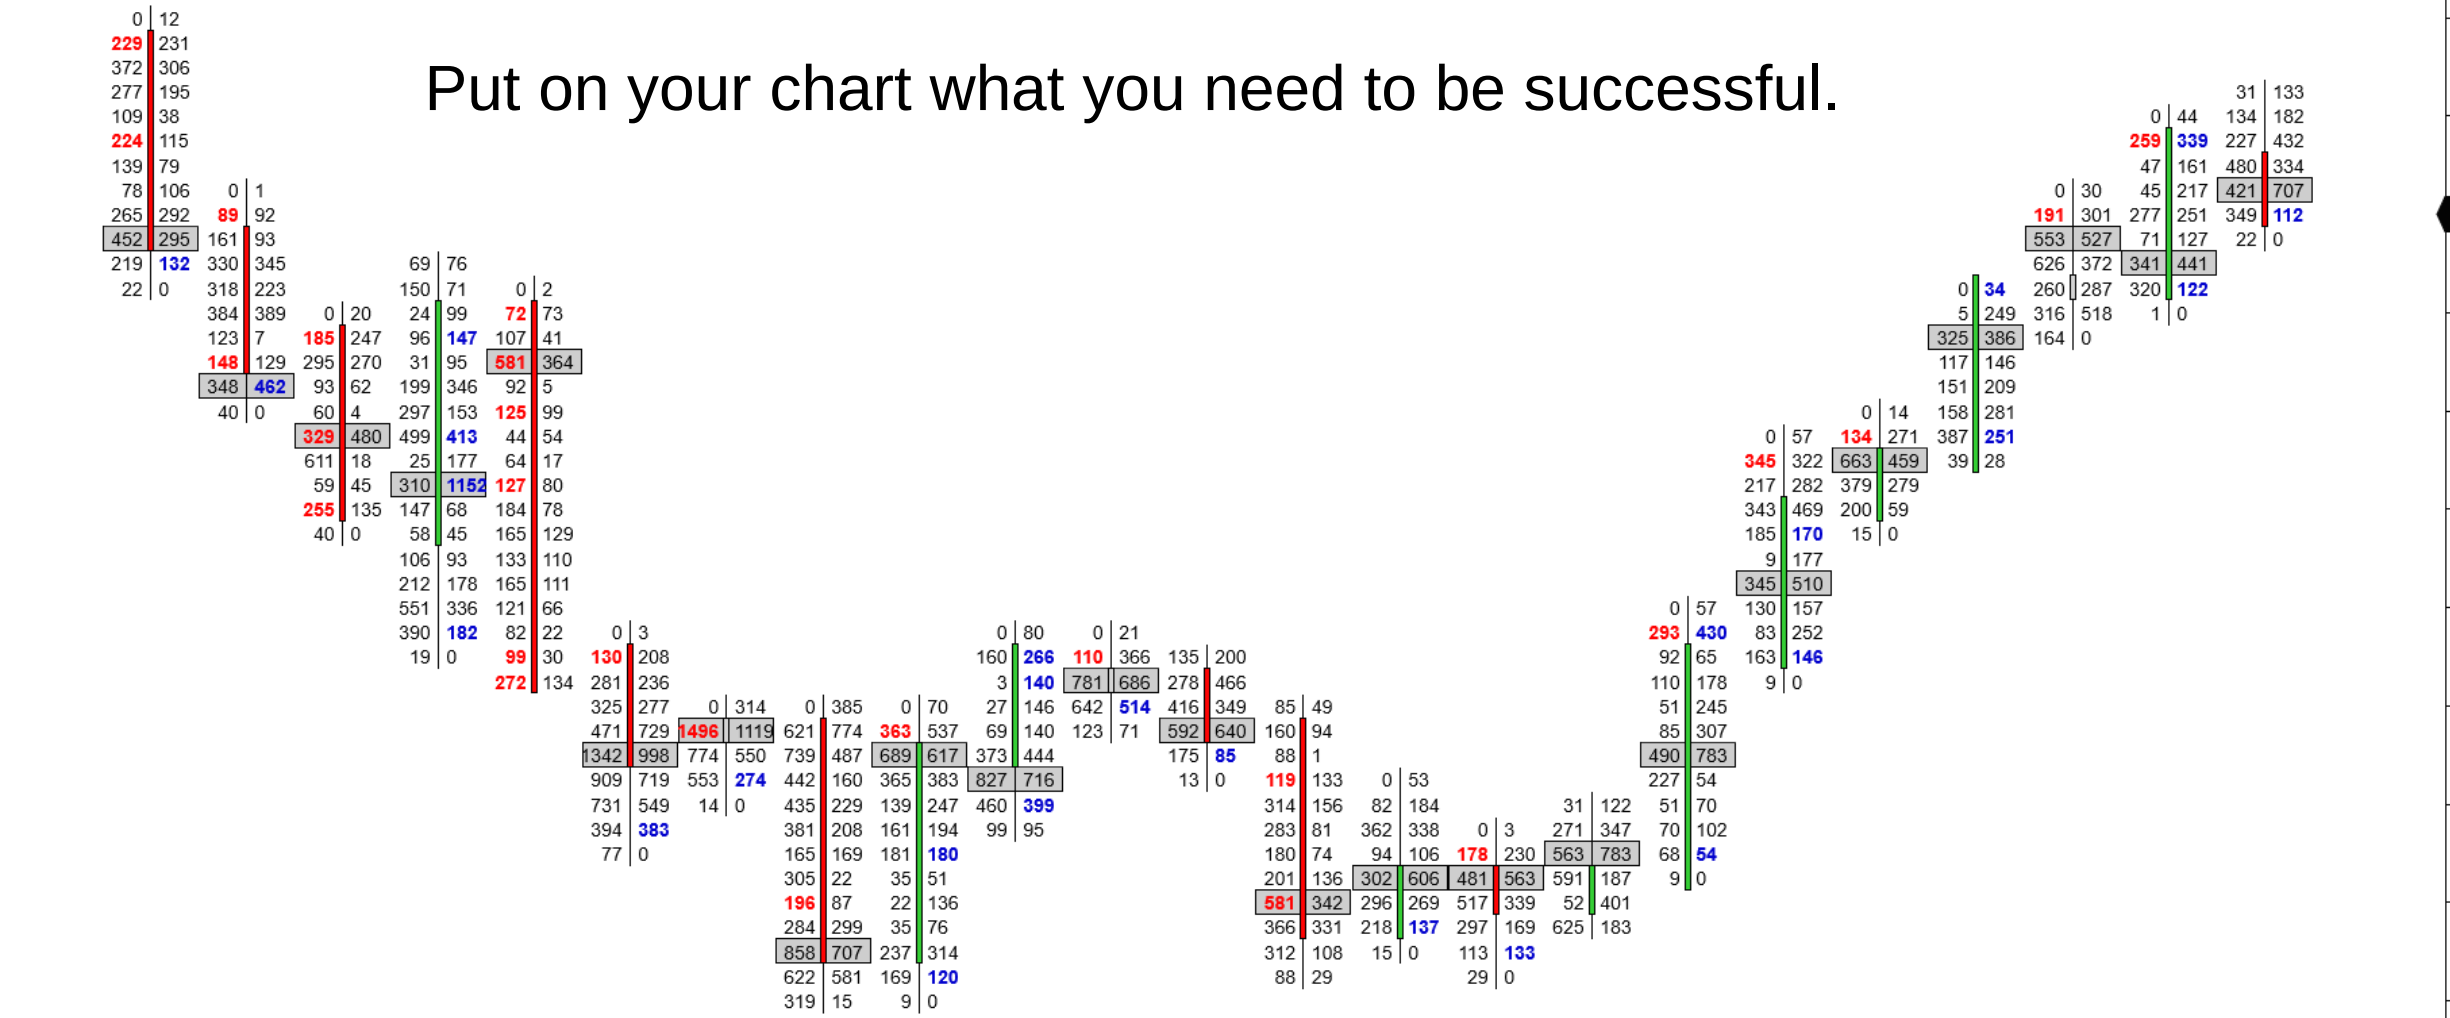

Types of Rotations: Rotations can be based on time or specific price movements (e.g., point and figure). Select the rotation type that best suits your trading approach.

Statistics: Include statistics that provide valuable summaries of volume, Delta, cumulative Delta, and price changes. These statistics help traders analyze market activity efficiently.

Is there a best time to trade order flow?

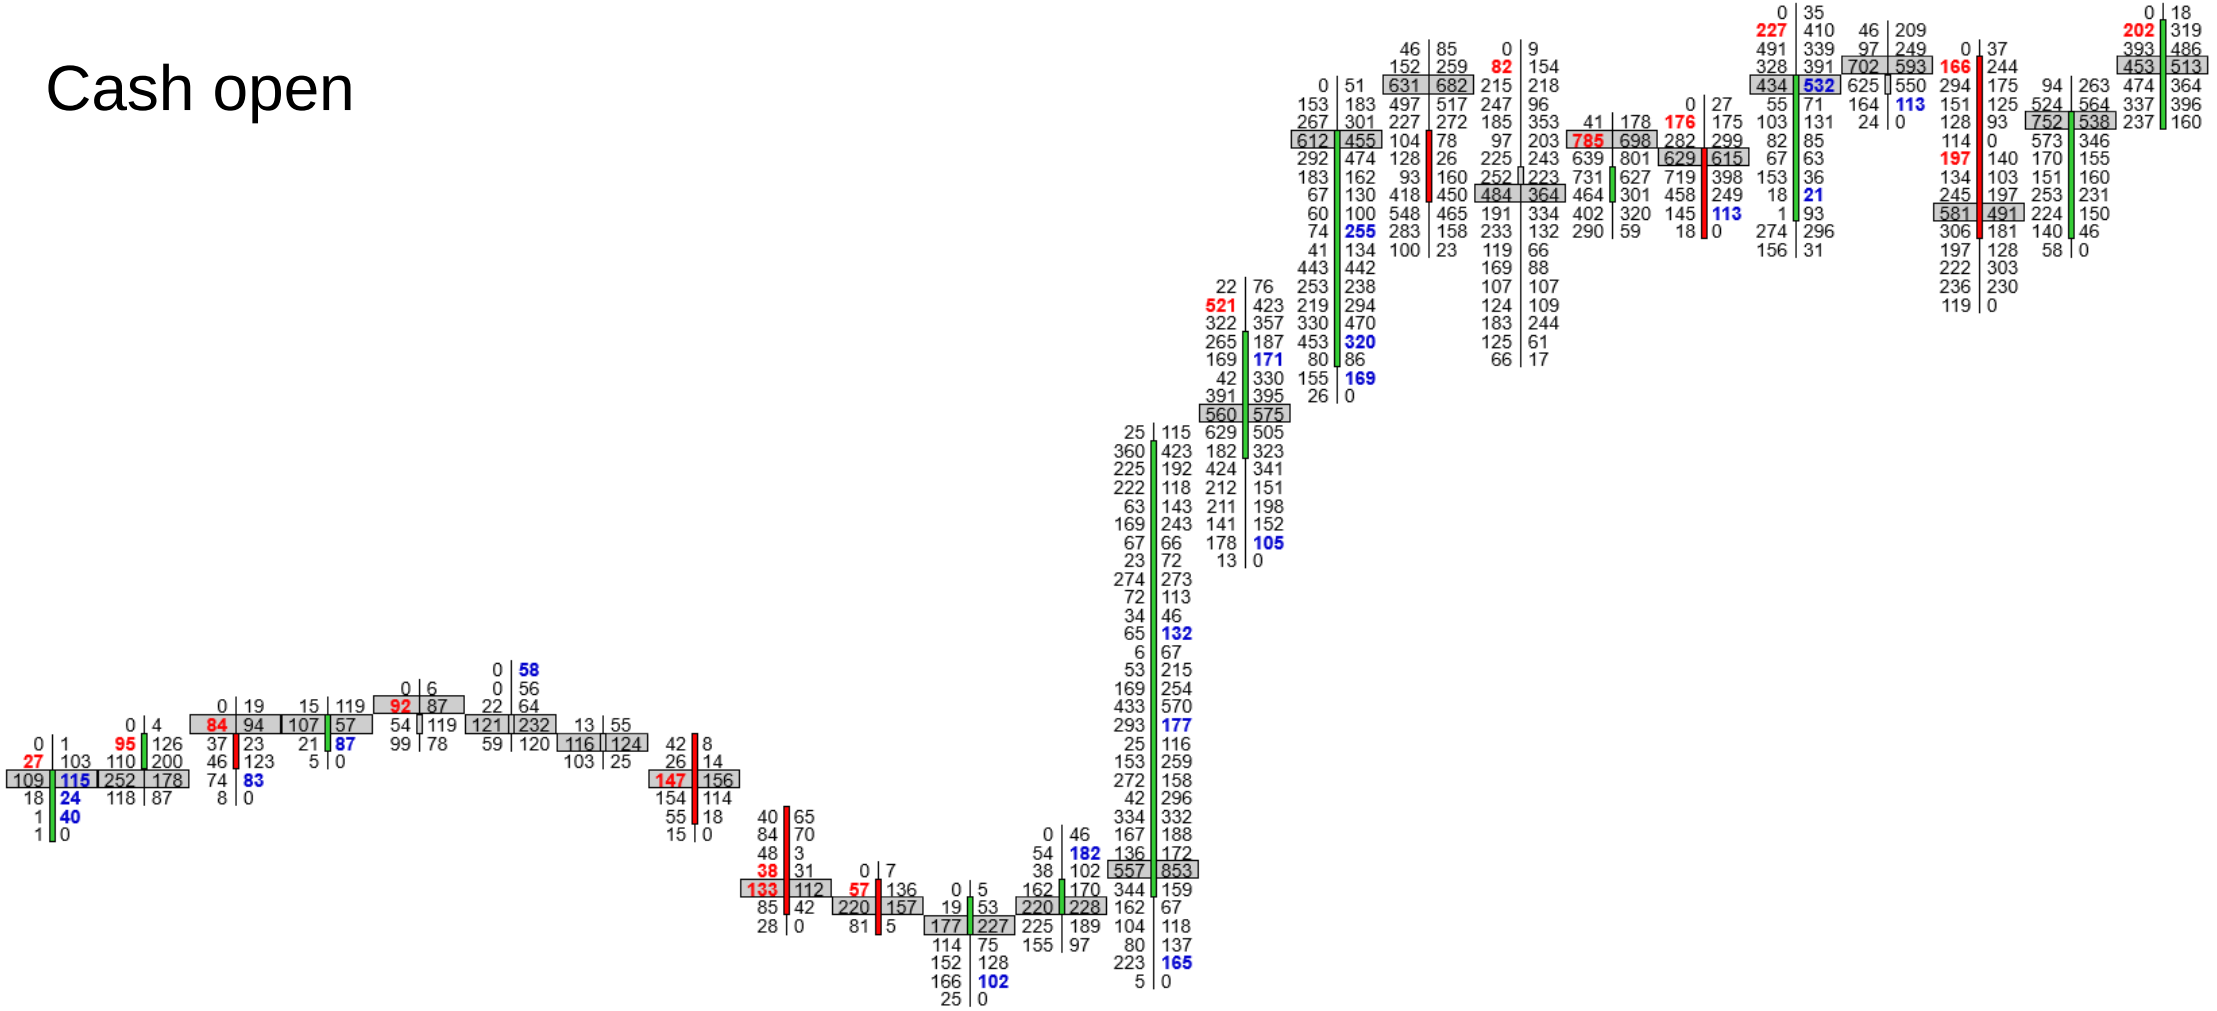

The Opening Range - There is often a surge of orders batched up overnight and released right at the open. This influx of orders provides good movement and liquidity to read the market's directional bias. Cash open.

Morning Period - The first hour after the open sees active trading, providing opportunities to fade the overnight sentiment and trade potential reversals back to the prior close. You can also see trend days develop during this period. This is probably the most active time (not highest volume necessarily) that traders are in front of their screens. It overlaps with the European session.

Lunch Period - Lower intraday volatility from 11am to 1pm Chicago time offers chances to monitor order flow dryness and prepare for the afternoon.

Afternoon Trend - From 1pm to 2pm Chicago time, sometimes intraday trends emerge as institutions position for the close. Joining the directional order flow in this period can ride momentum. But is the FED Zone.

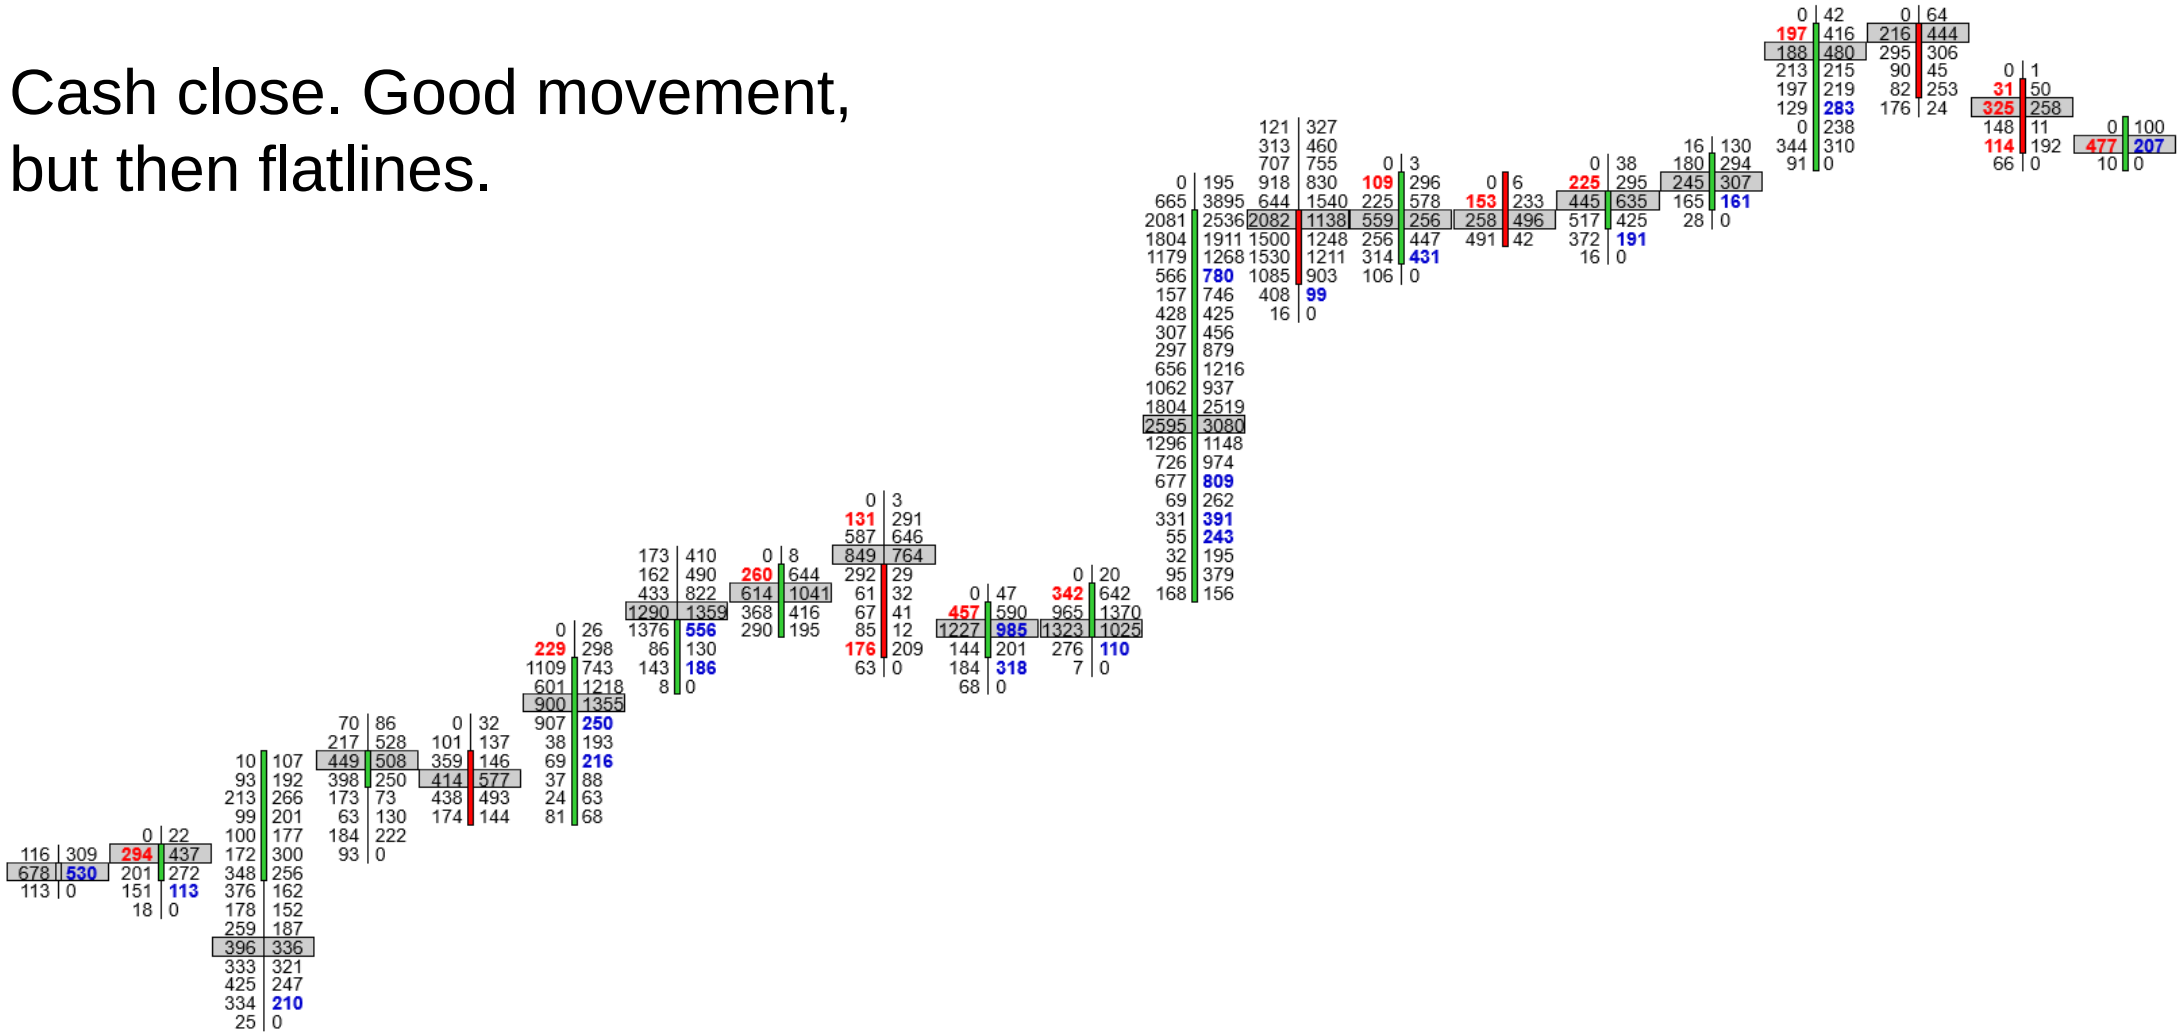

Closing Hour - The final hour sees another spike in volume and volatility as day traders' square positions and institutions complete rebalancing. Active order flow reveals the market's last-minute conviction into the close. Cash close is the final.

The bookend periods of market open and close provide surges in activity and order flow interaction to best read market conditions. The midday period presents opportunities as well. An adaptive trader can optimize order flow trading across different intraday periods.

By identifying areas with the maximum trading activity, traders can gain insights into market sentiment and behavior. Moreover, it is essential to observe how the price responds after significant trading activity occurs.

What happens on the cash open can give you direction.

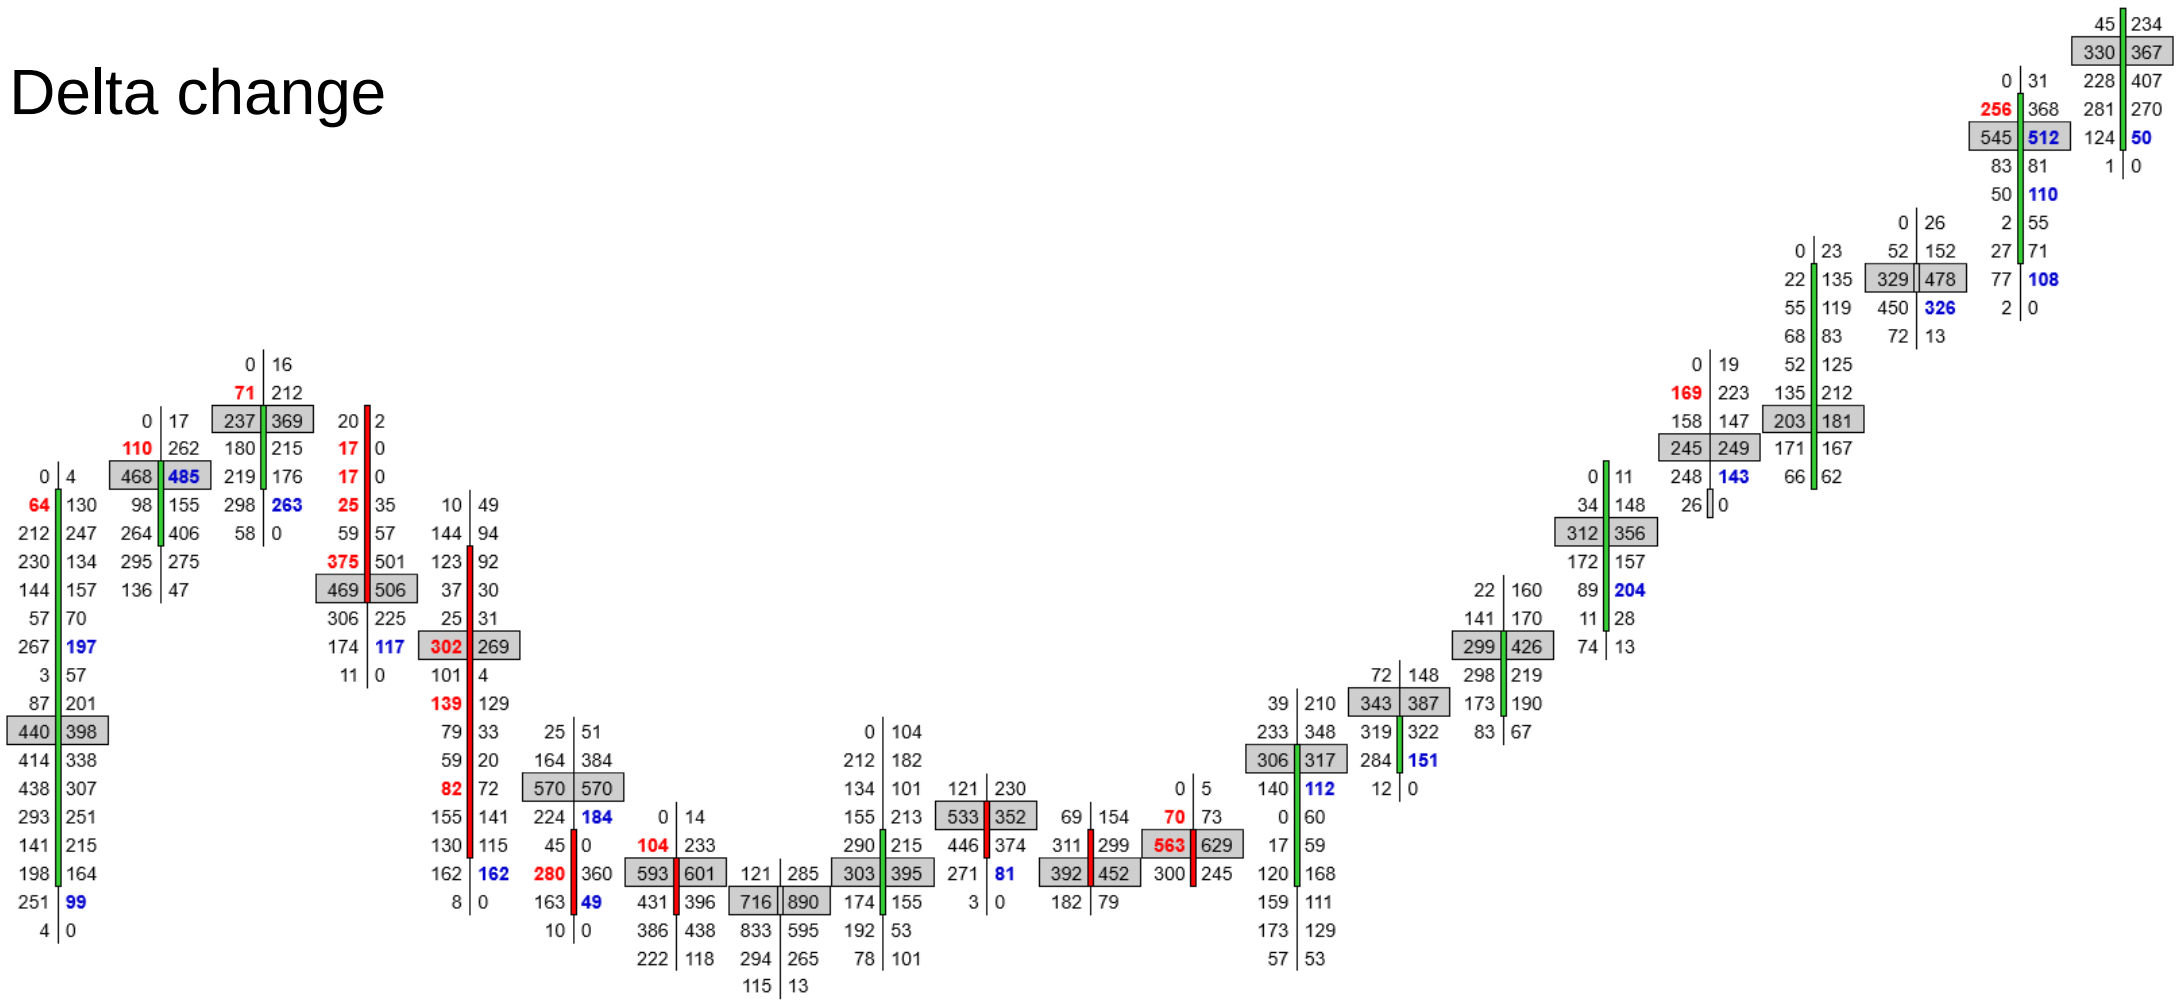

The delta change is the most important aspect to look at, as it shows the change in Delta from the previous bar, providing valuable information on market trends.

The delta change from the previous bar can indicate potential market reversals.

Extreme delta spikes tend to be unsustainable.

Increasing delta signals momentum is accelerating in that direction as aggressive traders pile in.

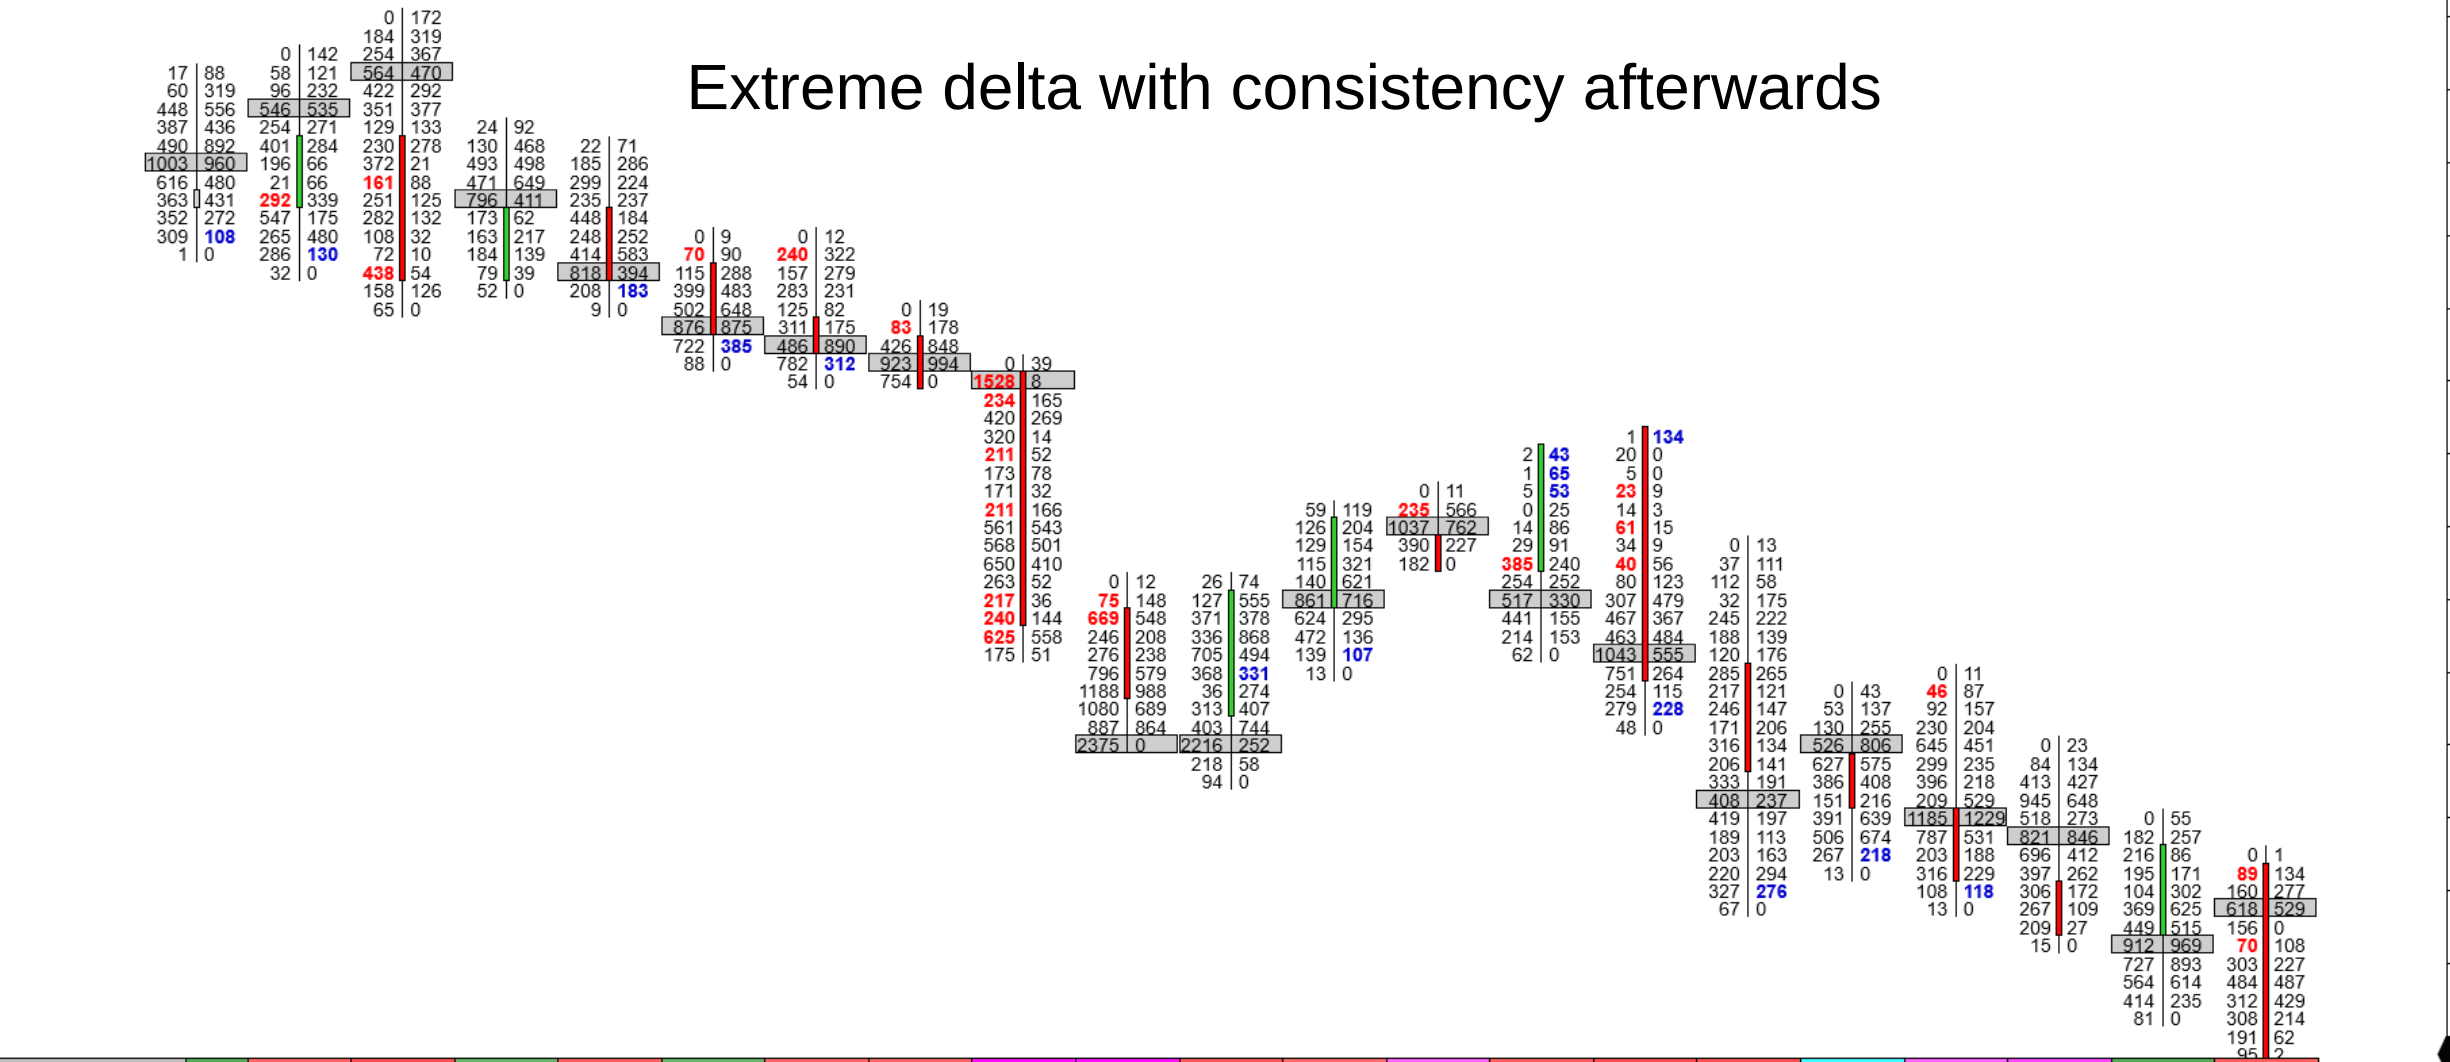

Focus on the rate of change in delta - sharp rises suggest urgency and conviction, slower delta increases = less commitment.

Net delta needs to expand and refresh to drive sustainable trends, not just spike.

Delta Momentum involves analyzing consecutive bars with consistent positive or negative Deltas. These consecutive bars indicate strong order flow in a particular direction, further confirming the prevailing trend. Traders can use Delta Momentum to focus exclusively on long or short trades based on the overall direction of order flow.

Benefits of using delta at price in order flow analysis:

It helps identify imbalances between buying and selling pressure. By looking at the delta (rate of change) in buy and sell order flow at different price levels, you can see where there is more aggressive buying or selling happening. Large positive delta indicates buying pressure, while large negative delta indicates selling pressure.

It reveals support and resistance levels. Price levels with consistently high positive or negative delta can act as support or resistance, representing areas where buyers or sellers are more active. Watching how delta evolves at key prices gives clues about the strength of these support/resistance zones.

Delta helps gauge the conviction behind moves. Large, rapid delta spikes show strong conviction behind buying or selling at a certain price level, versus slow steady delta changes which reflect less urgency. This can aid in assessing how meaningful a price move may be.

It acts as an early indicator of potential breaks or reversals. Shifts in delta often precede price breakouts and reversals, providing an early warning of change. If delta starts dropping at support, it flags breakdown risk, and vice versa for resistance.

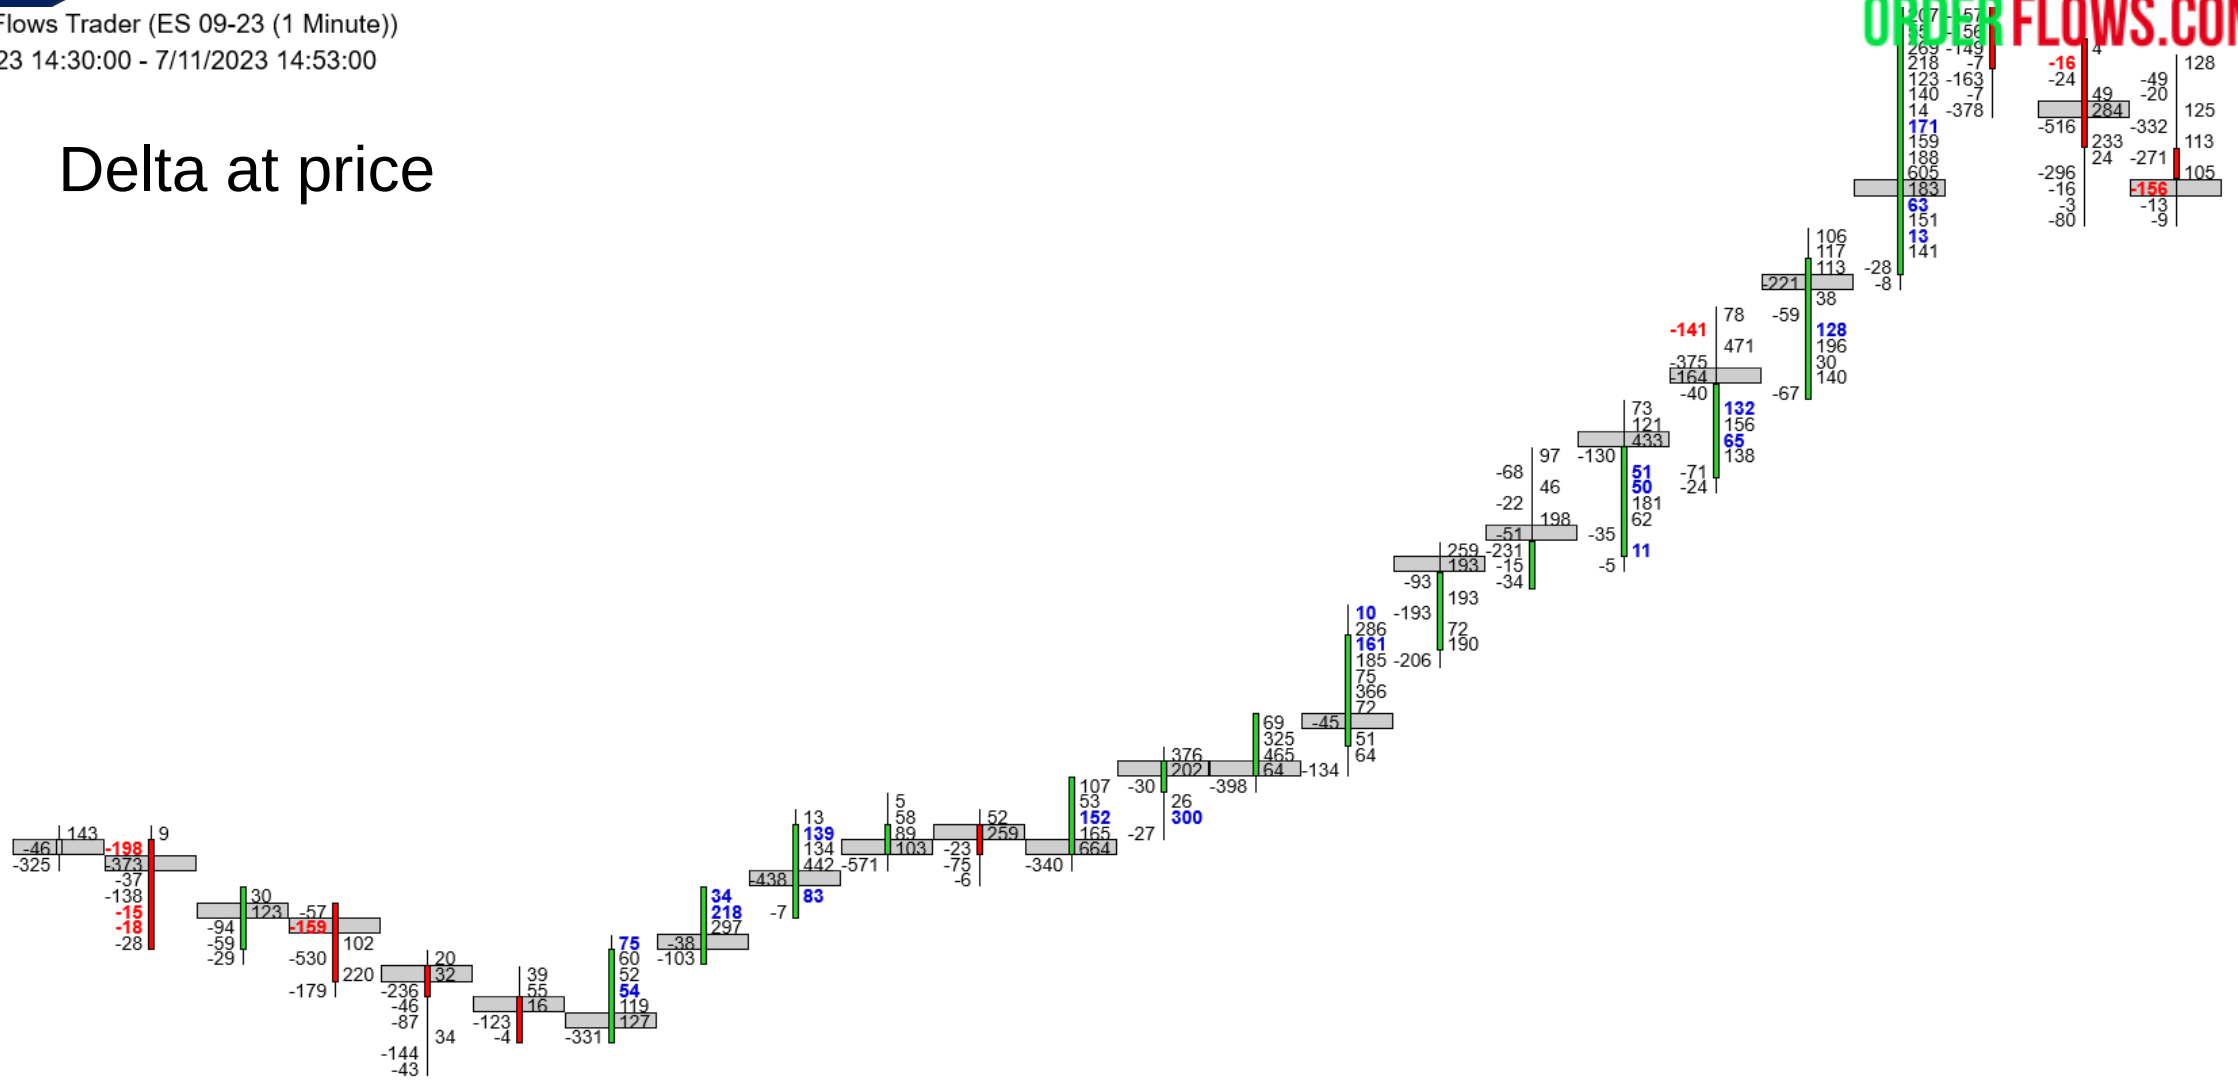

Delta at price gives a more accurate representation of buying and selling pressure - Delta at price looks at the net delta of orders at each price level rather than just the number of orders. This gives a better sense of the true buying or selling pressure, as larger orders have a bigger impact on delta.

Identifies support and resistance levels - Price levels with high net positive or negative delta can act as support or resistance, since it shows where substantial buying or selling interest exists. Watching how delta evolves at key prices is helpful for trading.

When you observe a market rally followed by the generation of support levels. This indicates a trending market moving higher. However, when the support levels start transforming into resistance, it suggests that the market's upward momentum may be diminishing.

The importance of order flow imbalance and its location in a footprint chart is that it provides valuable insights into the supply and demand dynamics at a given price level.

Imbalances can confirm or negate breakouts - Heavy buying or selling imbalances during a breakout increase chances it will be sustained. Lack of imbalance shows lack of conviction.

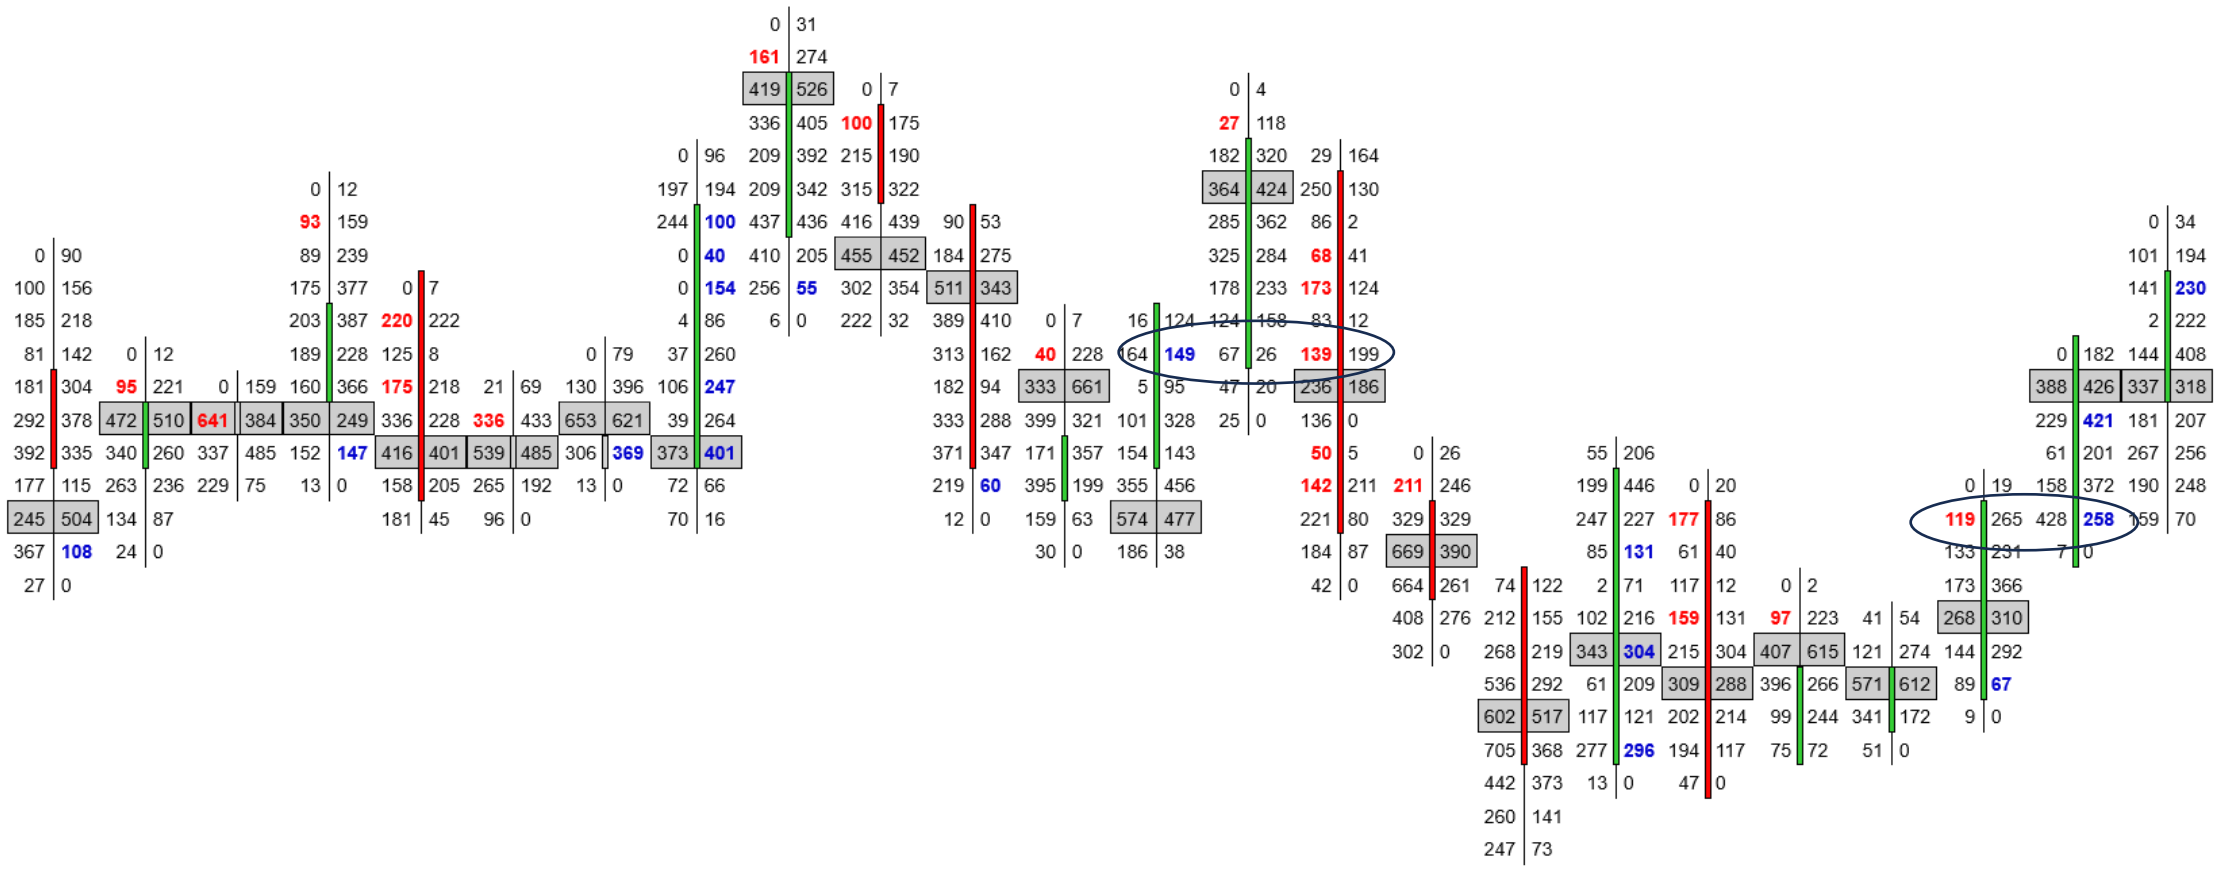

Traders can quantify the energy exerted during a price move and gain valuable insights into market activity. The ability to witness volume development vertically, rather than just horizontally, offers traders a more comprehensive understanding of market dynamics.

Imbalance changes show shifts in control - Flipping from selling to buying imbalances at a price level indicates a shift in control and increased likelihood prices will move up through that level. The opposite for flipping from buying to selling imbalances.

The point of control (POC) on a bar in order flow analysis provides very valuable information and context.

Indicates Fair Value - The POC marks the price where the most volume traded during that bar's timeframe. It represents where buyers and sellers agreed on "fair value". Watching POC shifts in a bar is insightful.

POC at top of green candles or bottom of red candles. Shows that volume is migrating through the bar.

You want to see volume migrating in a bar for a trending move.

If POC stays at the bottom of green bars it indicates support.
If POC stays at the top of red bars it indicates resistance.

Disadvantages of Footprint Charts

Setup Complexity: Properly setting up and configuring footprint charts requires time and effort. Traders need to define the specific parameters and rules based on their trading strategies, which may involve a learning curve and experimentation.

Continuous Learning: Mastering footprint chart analysis is an ongoing process that requires continuous learning and adaptation. Traders should invest time in understanding different patterns, interpreting price-volume interactions, and refining their approach to effectively utilize this tool.

Reading the story in a footprint chart involves interpreting market dynamics based on factual observations. By analyzing volume, Delta, price changes, and liquidity, traders can form a clear understanding of the market's narrative. This allows for better decision-making and pattern recognition over time.

This concludes Module 2.

In Module 3, I will discuss
Advanced Order Flow Concepts
