Strategic Order Flow Trading

Module 5
Leveraging Order Flow

Disclaimer

This course is for educational and informational purposes only and should not be considered a solicitation to buy or sell a futures contract or make any other type of investment decision. Futures trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing ones financial security or life style. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

CFTC Rules 4.41 - Hypothetical or Simulated performance results have certain limitations, unlike an actual performance record, simulated results do not represent actual trading. Also, since the trades have not been executed, the results may have under-or-over compensated for the impact, if any, of certain market factors, such as lack of liquidity. Simulated trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve profit or losses similar to those shown.

Understanding how price fluctuates to facilitate trades and the role of the aggressor is key to trading order flow effectively. Here are some key points:

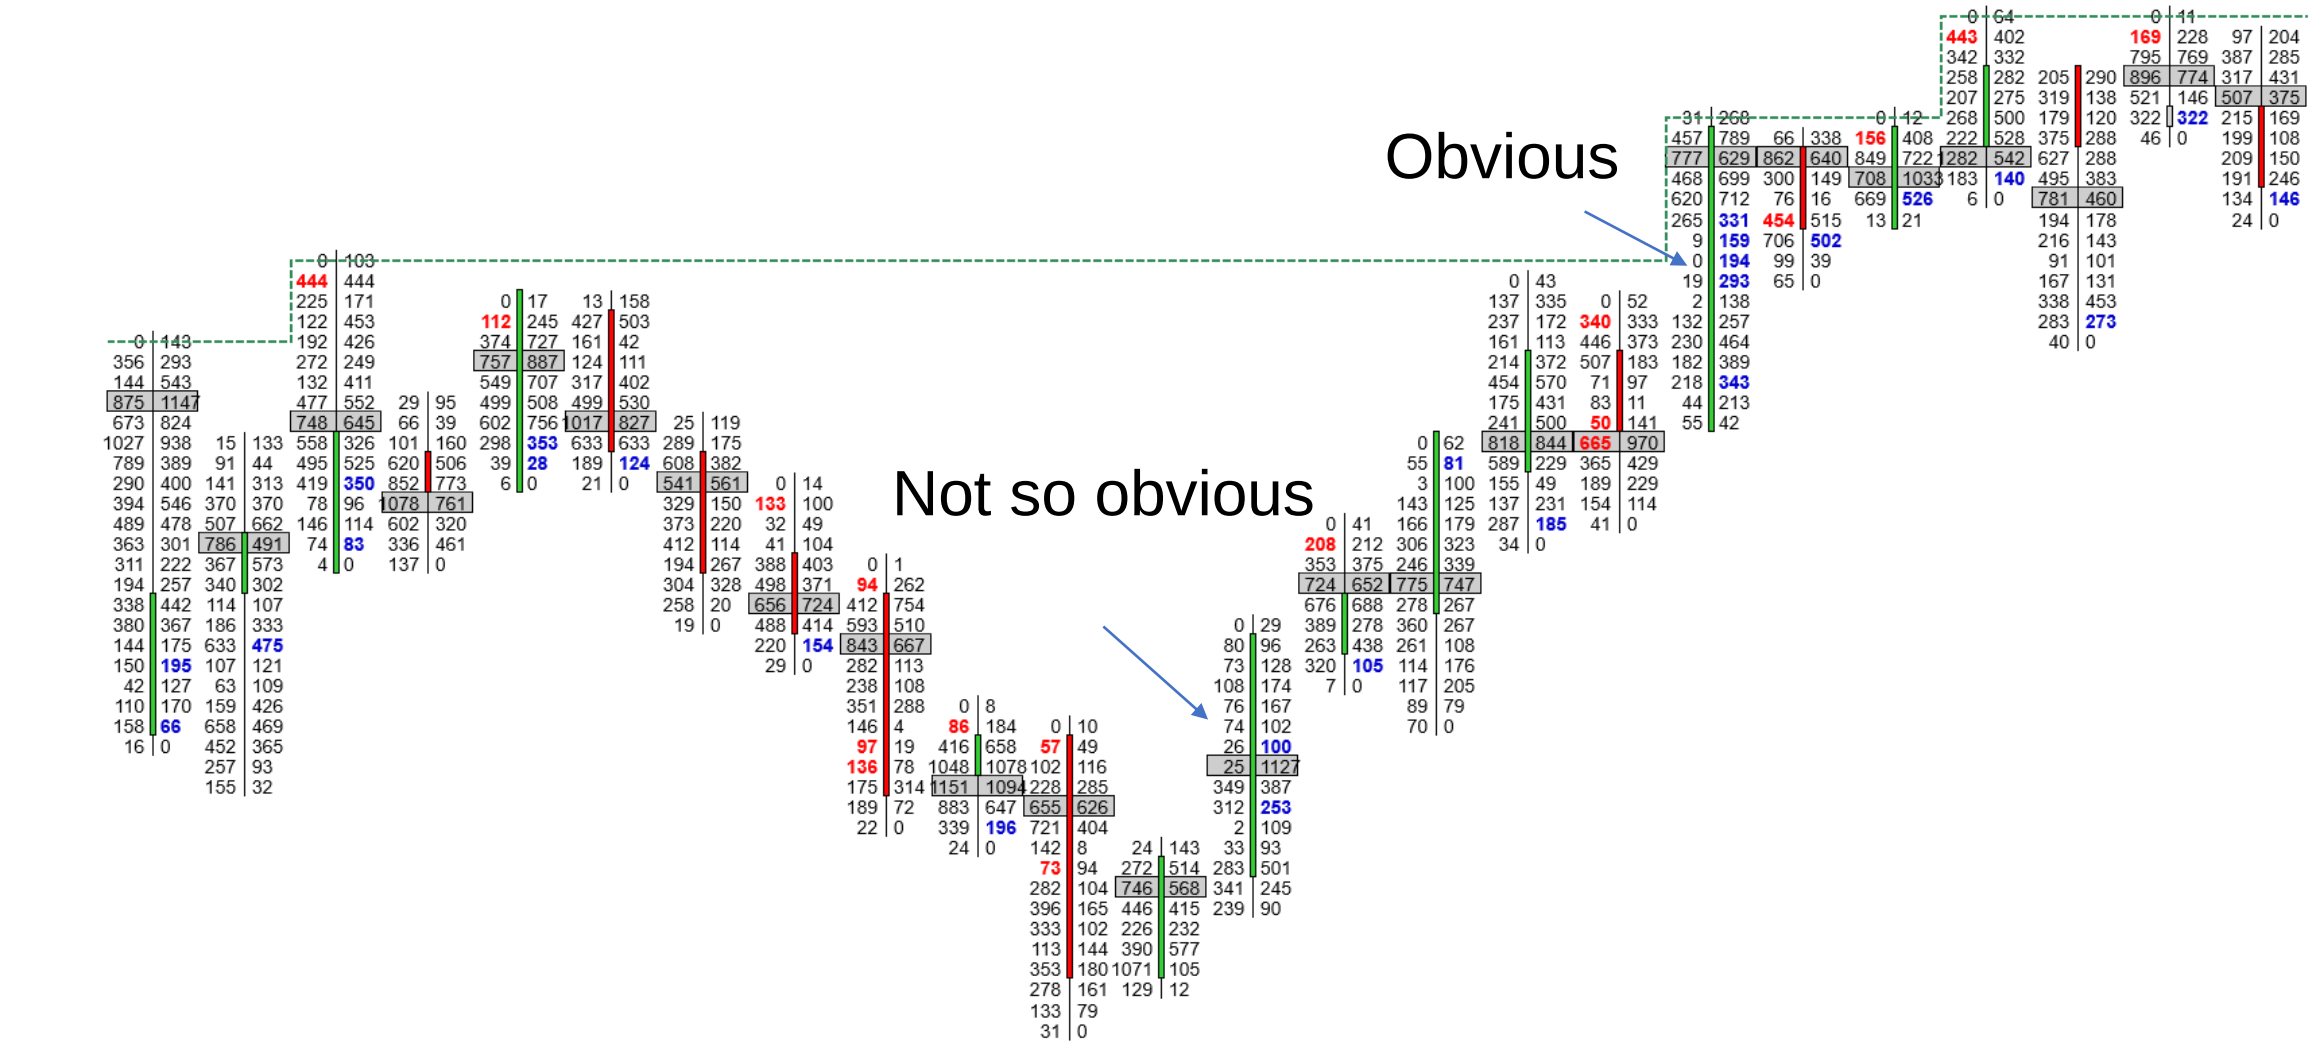

Price moves when an aggressor is willing to cross the spread and initiate transactions at the bid or ask. Without aggression, price stagnates.

Aggressors absorb liquidity from resting orders on the books to facilitate trades. This moves price towards aggressors' intended direction.

Watch for aggressors lifting offers (or hitting the bid for selling) signaling buying interest versus joining the bid queue which lacks conviction.

The more aggression applied; the further price is propelled. High volumes transacted rapidly reveal aggressive appetite.

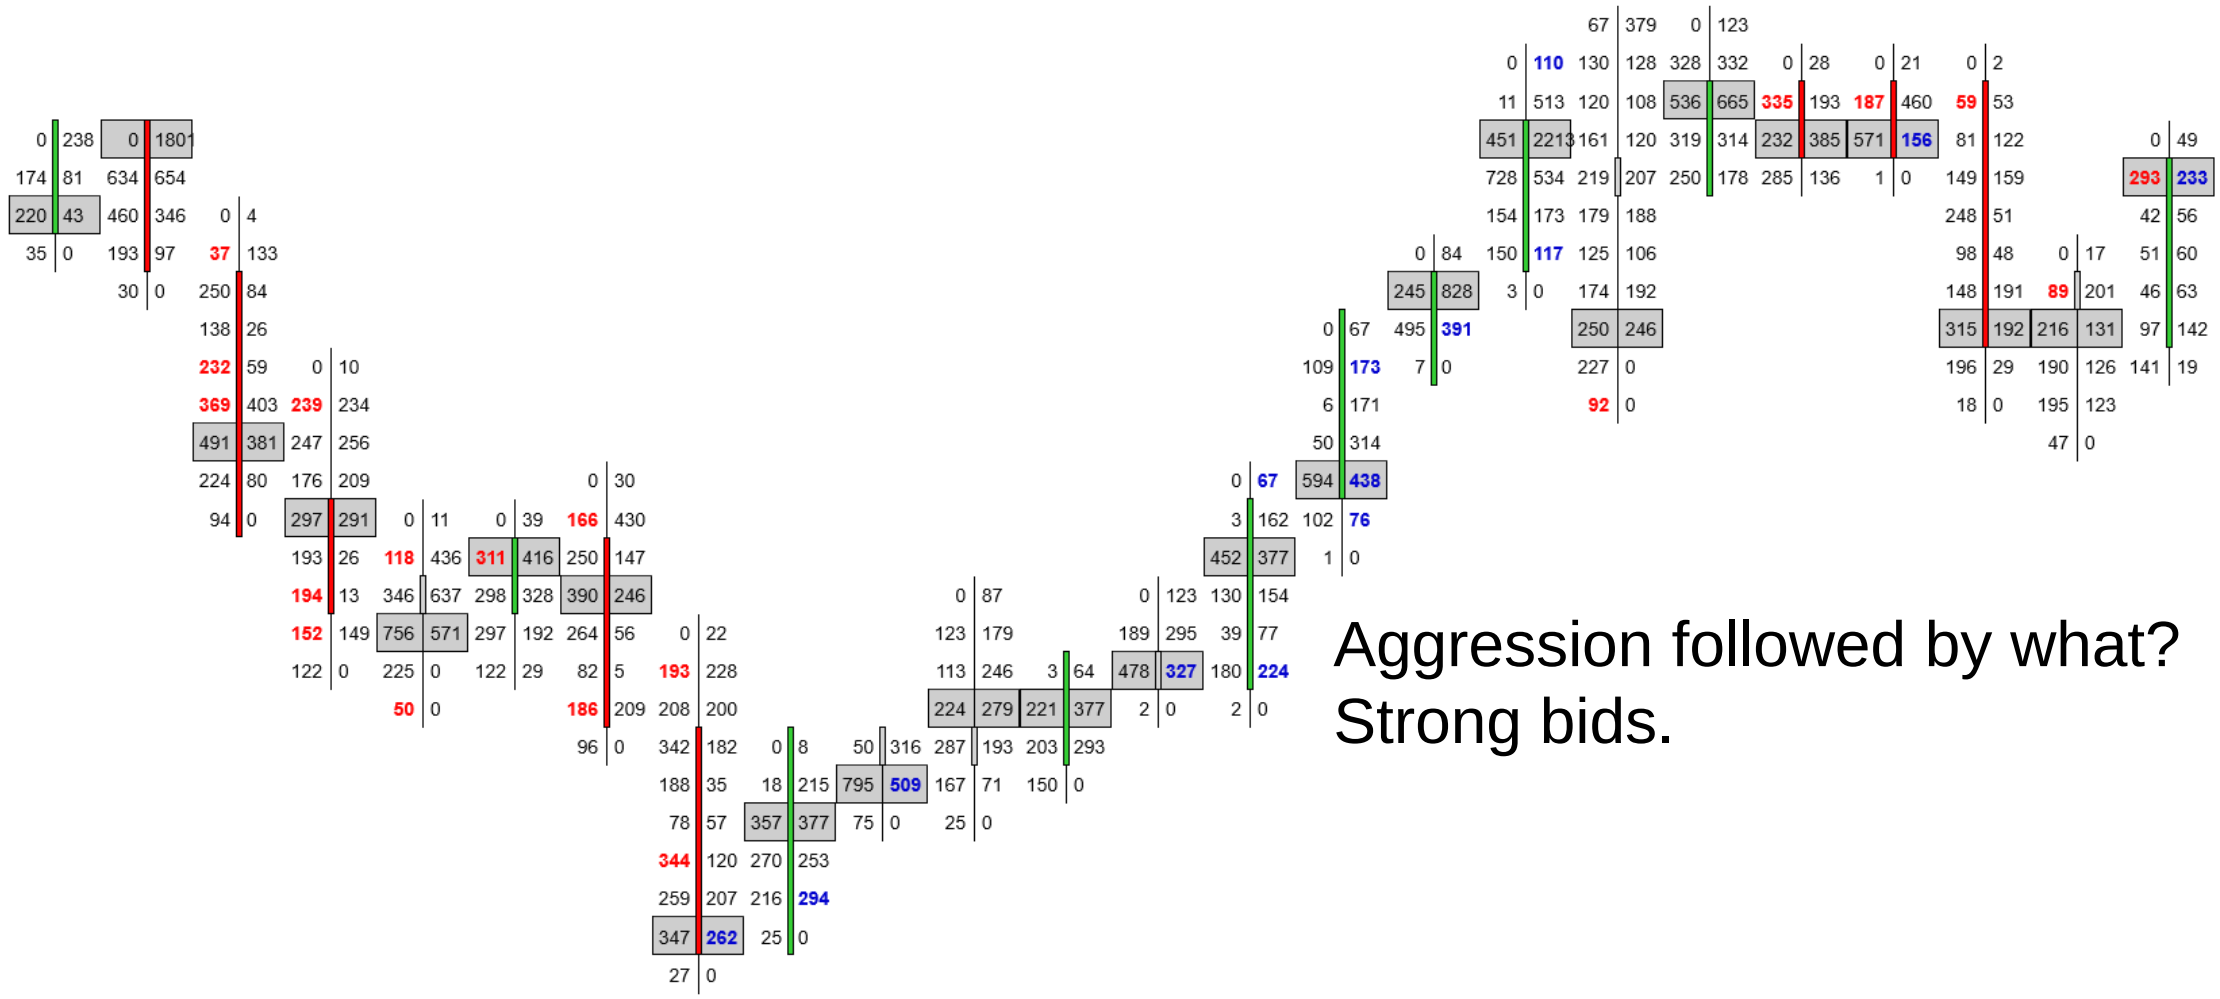

Initiating transactions require paying the spread cost. Passive traders won't cross spread, allowing price to gravitate towards aggressors.

Traders must determine if emerging aggression is genuine or false through assessing order flow nuances. (Take context into consideration – where is the market moving away from?)

Balanced markets see rotations between aggressor and passive stance. Buyers and sellers alternate control.

True one-sided aggression that goes unchallenged creates directional momentum and trends.

In essence, the aggressor is the engine driving price movement. Reading aggression and initiative activity in the order flow is key to trading it profitably. This takes practice to master.

Recognizing flow-driven days with high volume and high volatility can provide potential opportunities for traders, despite the perceived volatility.

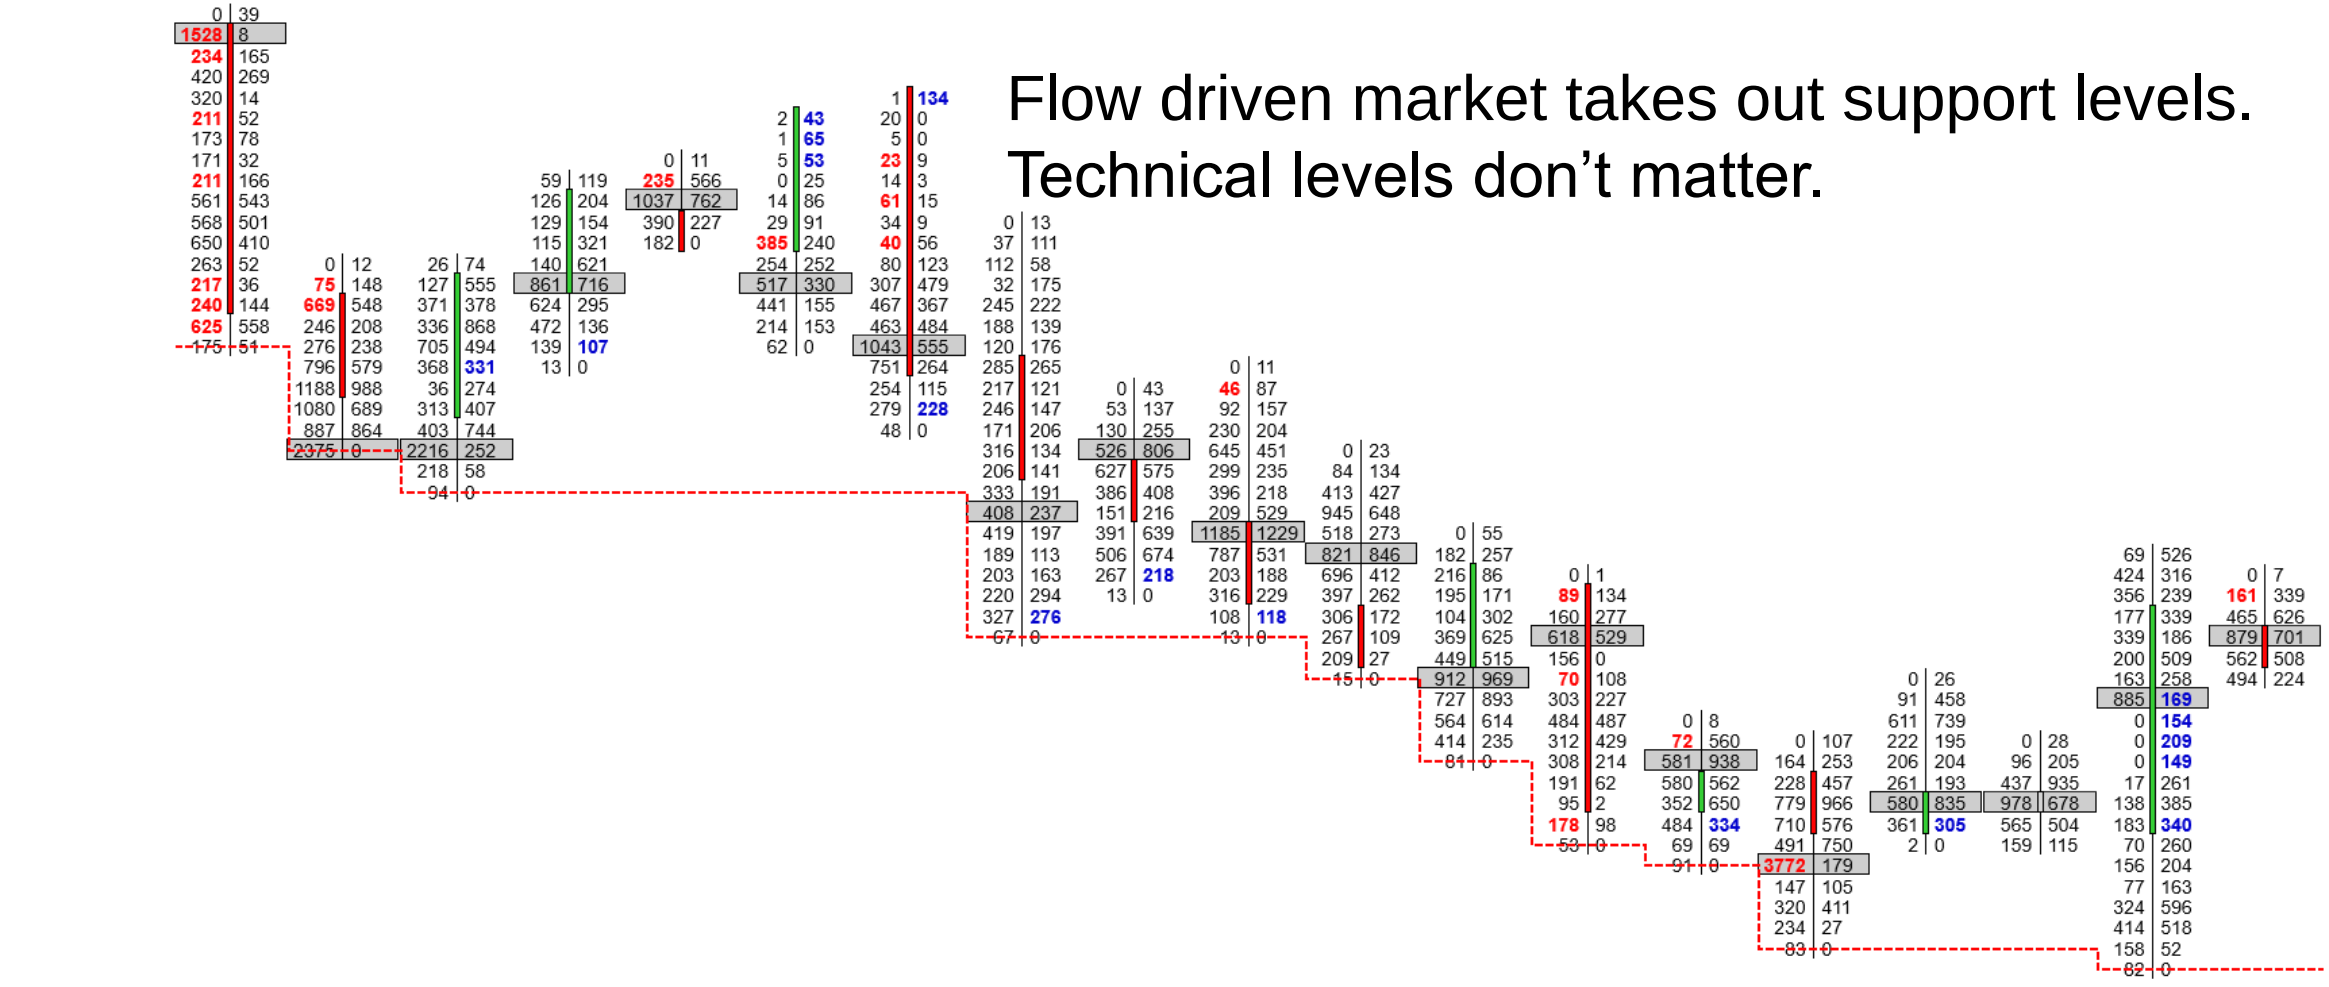

Flow-driven markets are characterized by participants who are more aggressive and not so much price-sensitive, with less emphasis on technical analysis, making it crucial to understand the dynamics and adjust trading strategies accordingly.

Differentiating between flow-driven and technical markets is essential for effective trading. In flow-driven markets, where participants are initiating trades and responding to market conditions, the emphasis is on price direction rather than technical analysis. Liquidity providers play a critical role in these markets. Conversely, in technical markets, where price movements respect technical levels and patterns, traders need to adapt their approach. Recognizing the characteristics of each market type enables traders to adjust their strategies and participate in market moves with higher probability.

In flow-driven markets, where volatility is often high, traders can take advantage of price fluctuations and the heightened activity. In technical markets, where volatility is relatively low, traders can leverage technical analysis to identify potential entry and exit points.

In flow-driven markets, just go with the flow…so to speak.

In a volatile market, liquidity can be scarce, meaning there are fewer participants providing liquidity for buyers and sellers. This scarcity of liquidity can have significant consequences for traders. For instance, when the market experiences a sharp rally, the price may briefly touch a resistance level before rebounding. However, in a volatile condition, there may not be enough liquidity to sustain the price at that resistance level. As a result, the price might quickly break through the resistance level, causing traders who were trying to short at resistance to incur losses.

On the other hand, in less volatile conditions, there is usually more liquidity available in the market. In this scenario, when the price approaches a support level, there is enough liquidity to absorb the selling pressure, causing the price to halt its decline and potentially reverse direction. Traders who enter the market at this point may be able to profit from the rebound.

Finished and Unfinished Auctions

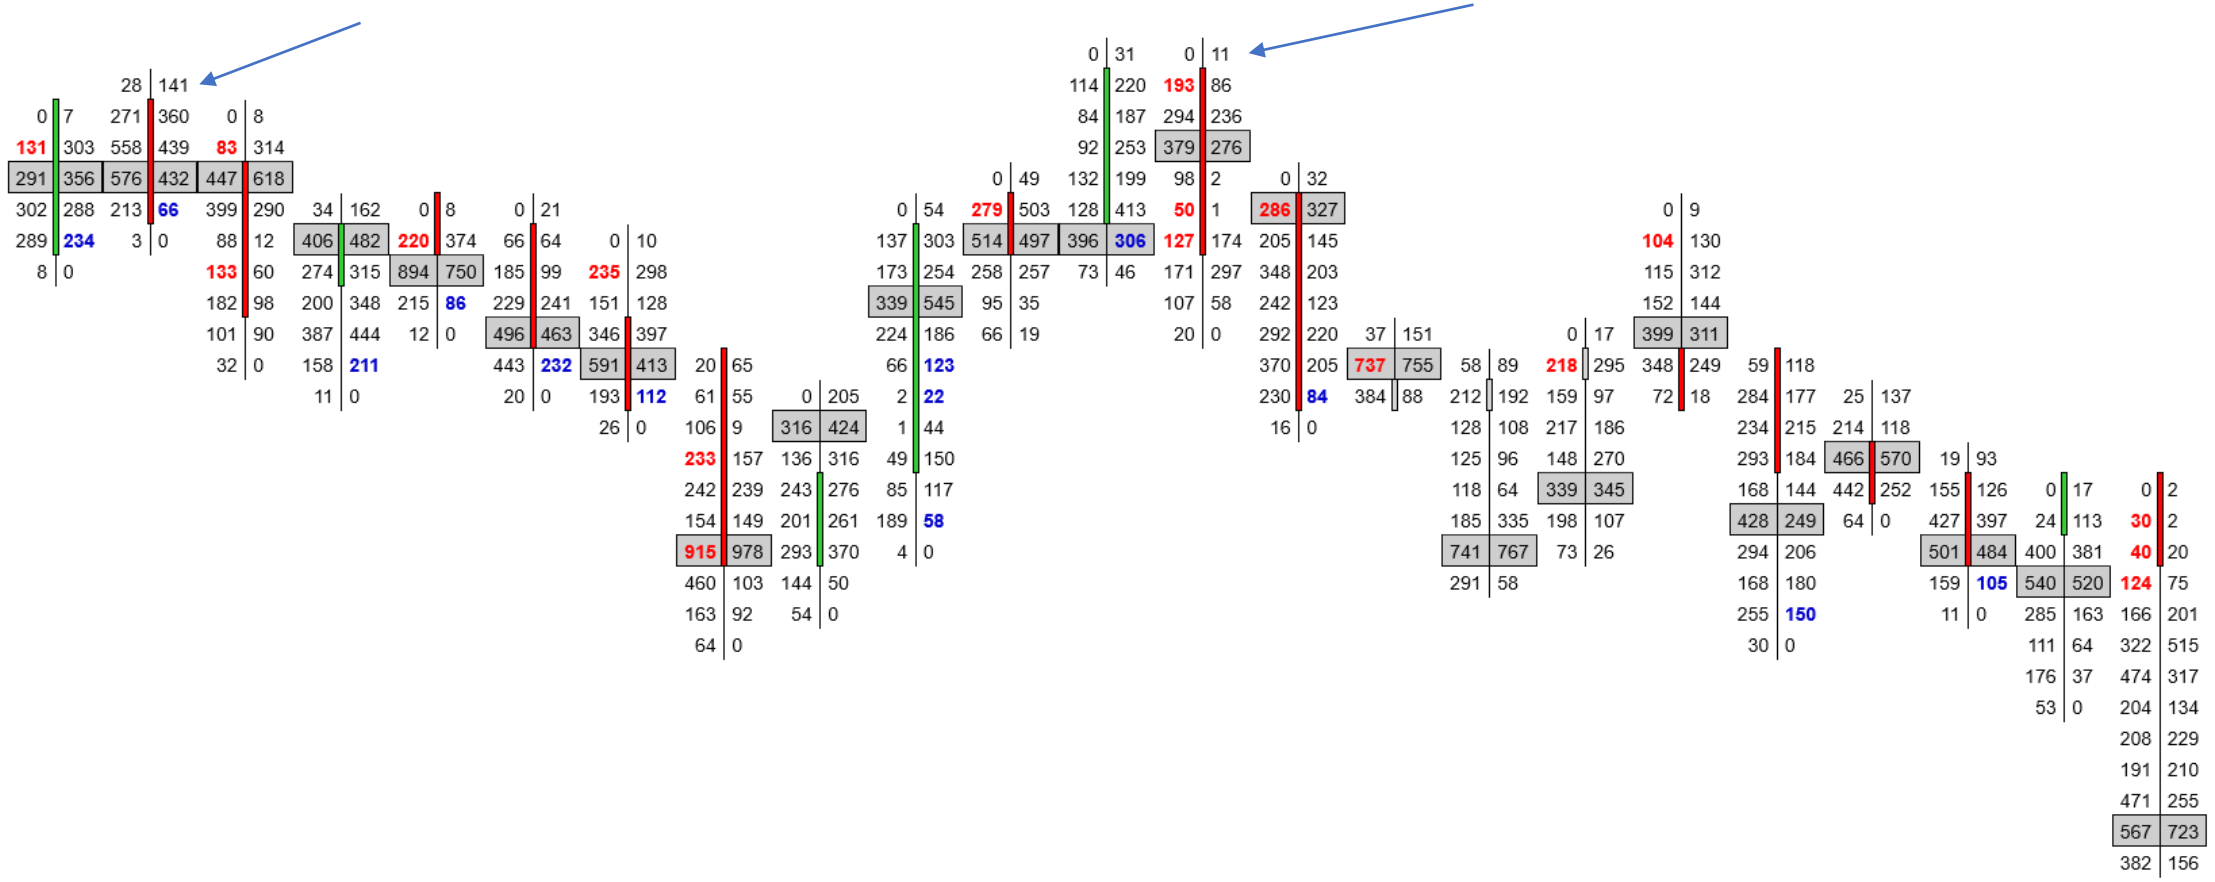

One of the key concepts in footprint analysis is the idea of finished and unfinished auctions. An unfinished auction occurs when there is trading activity on both the bid (buy) and ask (sell) sides of the market. This indicates that the market is still in a state of price discovery and is considered an unfinished auction. On the other hand, a finished auction occurs when there is a significant volume of trades on one side of the market, indicating that price discovery has concluded.

A finished auction is a strong indication that price discovery has concluded, and a reversal may be imminent. Traders look for instances where there is a significant volume of trades on one side of the market, signaling a potential turning point.

ORDERFLOWS.COM

Finished auctions on retests of highs.

Swing highs.

Unfinished Auctions occur exclusively at the top or bottom of a price bar. These patterns indicate that the market has not fully explored a particular price level and can provide valuable information about potential reversals.

Traders can use Unfinished Auction patterns to identify opportunities to trade back to highs or lows, to finish the auction.

This concludes Module 5.

In Module 6, I will discuss
Order Flow Strategies & Setups
