Strategic Order Flow Trading

Module 7
Inefficient Markets

Disclaimer

This course is for educational and informational purposes only and should not be considered a solicitation to buy or sell a futures contract or make any other type of investment decision. Futures trading contains substantial risk and is not for every investor. An investor could potentially lose all or more than the initial investment. Risk capital is money that can be lost without jeopardizing ones financial security or life style. Only risk capital should be used for trading and only those with sufficient risk capital should consider trading. Past performance is not necessarily indicative of future results.

CFTC Rules 4.41 - Hypothetical or Simulated performance results have certain limitations, unlike an actual performance record, simulated results do not represent actual trading. Also, since the trades have not been executed, the results may have under-or-over compensated for the impact, if any, of certain market factors, such as lack of liquidity. Simulated trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve profit or losses similar to those shown.

The efficient market hypothesis argues market prices fully reflect all available information at any given time. New information is rapidly incorporated into prices.

That it's difficult to consistently outperform the broader market after accounting for fees and risk, supporting the notion that current prices accurately capture fundamental values.

With all the high-speed algorithms, retail participation, and abundant data, markets rapidly process information into price changes before obvious mispricing's emerge.

But nothing is ever 100% efficient all the time. We just need to identify those times when the market is not being efficient.

When there is inefficiency, that is an opportunity for traders to capitalize on.

You may not realize it, but some of the most popular forms of trading look for inefficiency:

When market prices deviate from estimated fair values, it creates potential mispricing for traders to exploit. Acting on inefficiencies can be profitable.

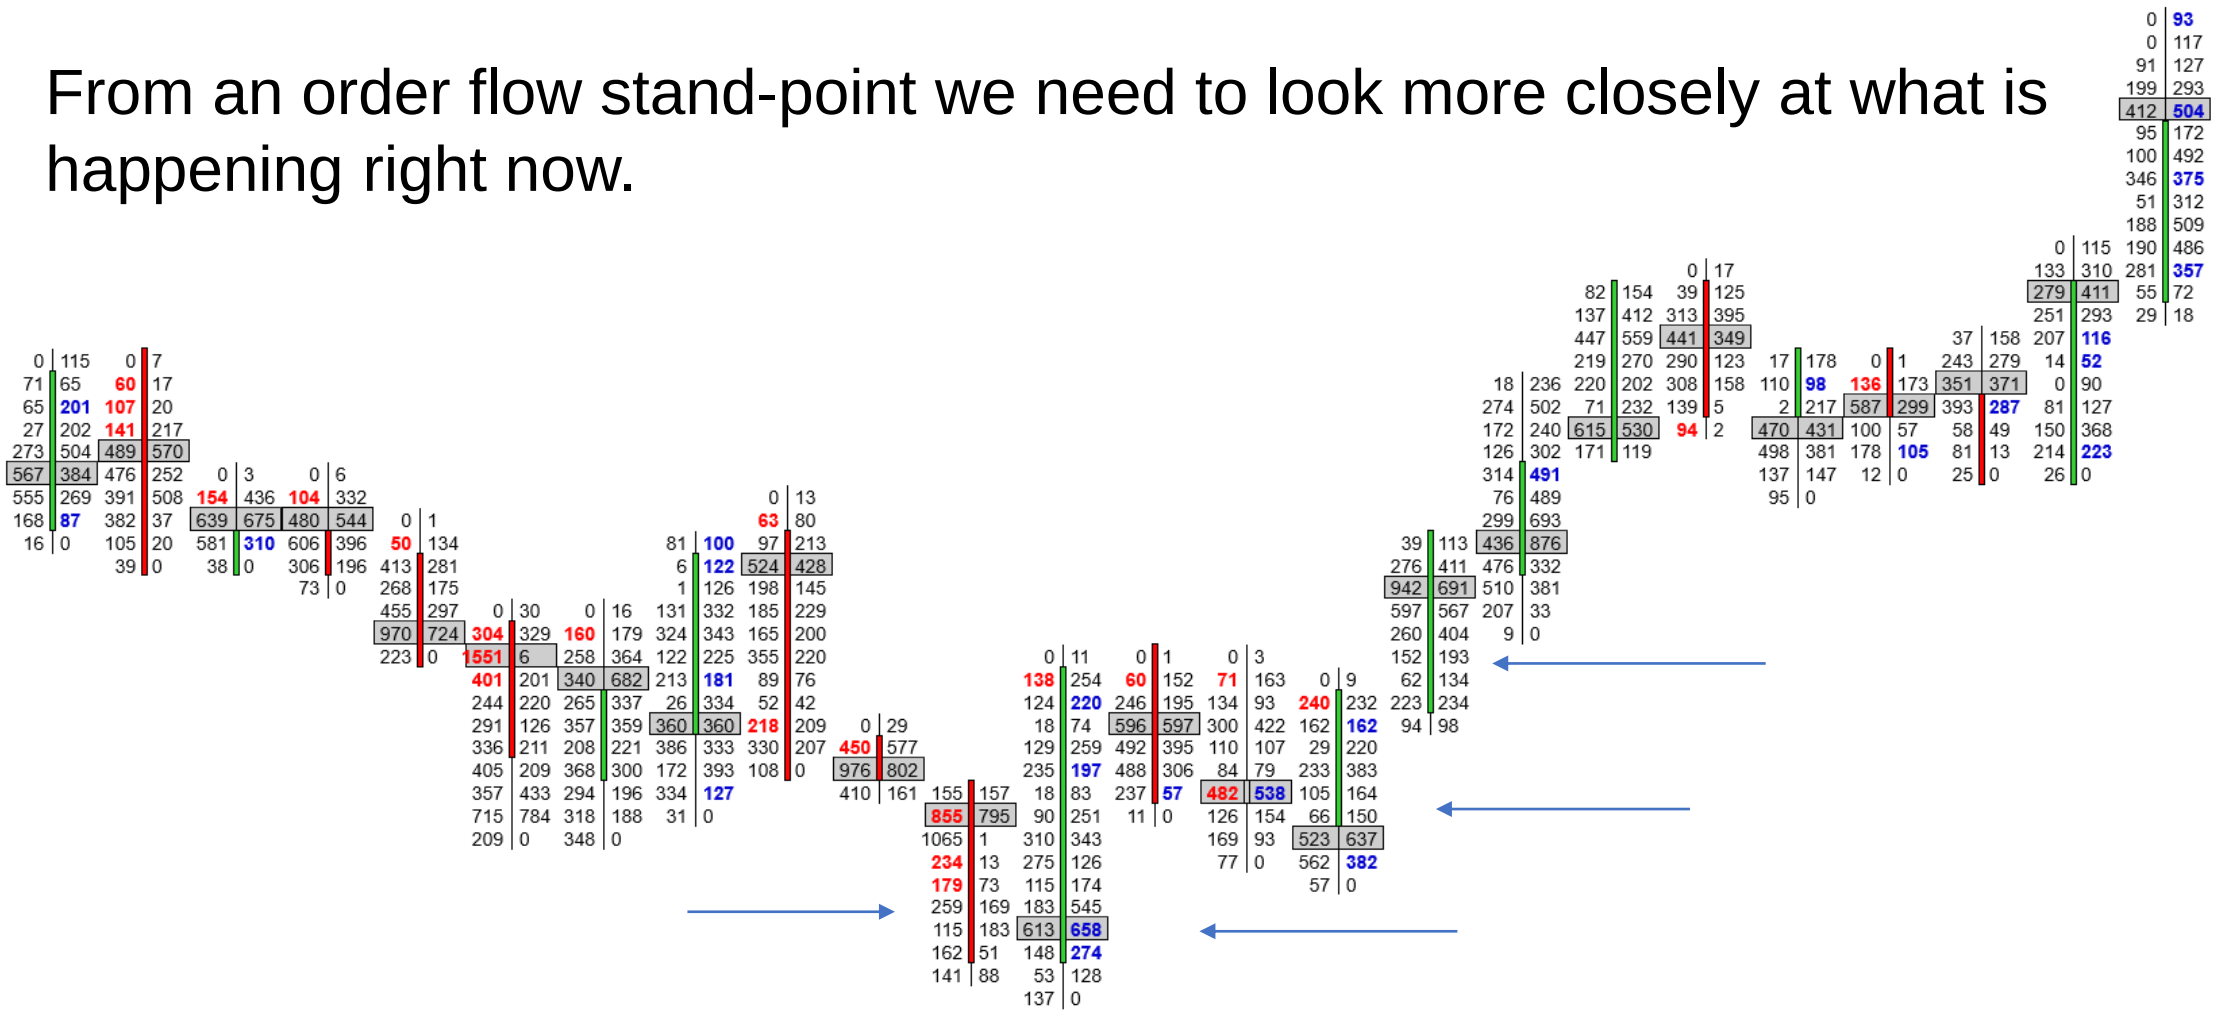

Panic selling can disconnect prices from fundamentals. This provides an edge to traders acting on emotion-driven inefficiencies.

Trading strategies like trend following or mean reversion strategies, aim to systematically extract profits from temporary inefficiencies.

Order Flows Trader (ES 09-23 (1 Minute))

Here are some signs of market inefficiency to look for when day trading using order flow:

Wide bid/ask spreads - This signals low liquidity and potential for volatility if large orders hit. Watch your DOM.

Price dislocation from value - If price diverges drastically from fair value, it presents mean reversion potential. Go with trade. Directional.

Thin Prints (Low volume) - Low volume at price levels indicates lack of commitment. Price may not hold. Go with trade. Directional.

Reactionary flow - If flow simply reacts to price changes rather than leading them, the order flow is inefficient.

Repeated rejections - Price spikes that get rejected back to the same area over and over.

High volatility - Markets swing rapidly between extremes as participants react. Lower stability.

Poor liquidity across price range - Sparse prints and volume through wide price zones.

Lack of follow-through - Breakouts and spikes fail to hold as no absorption follows.

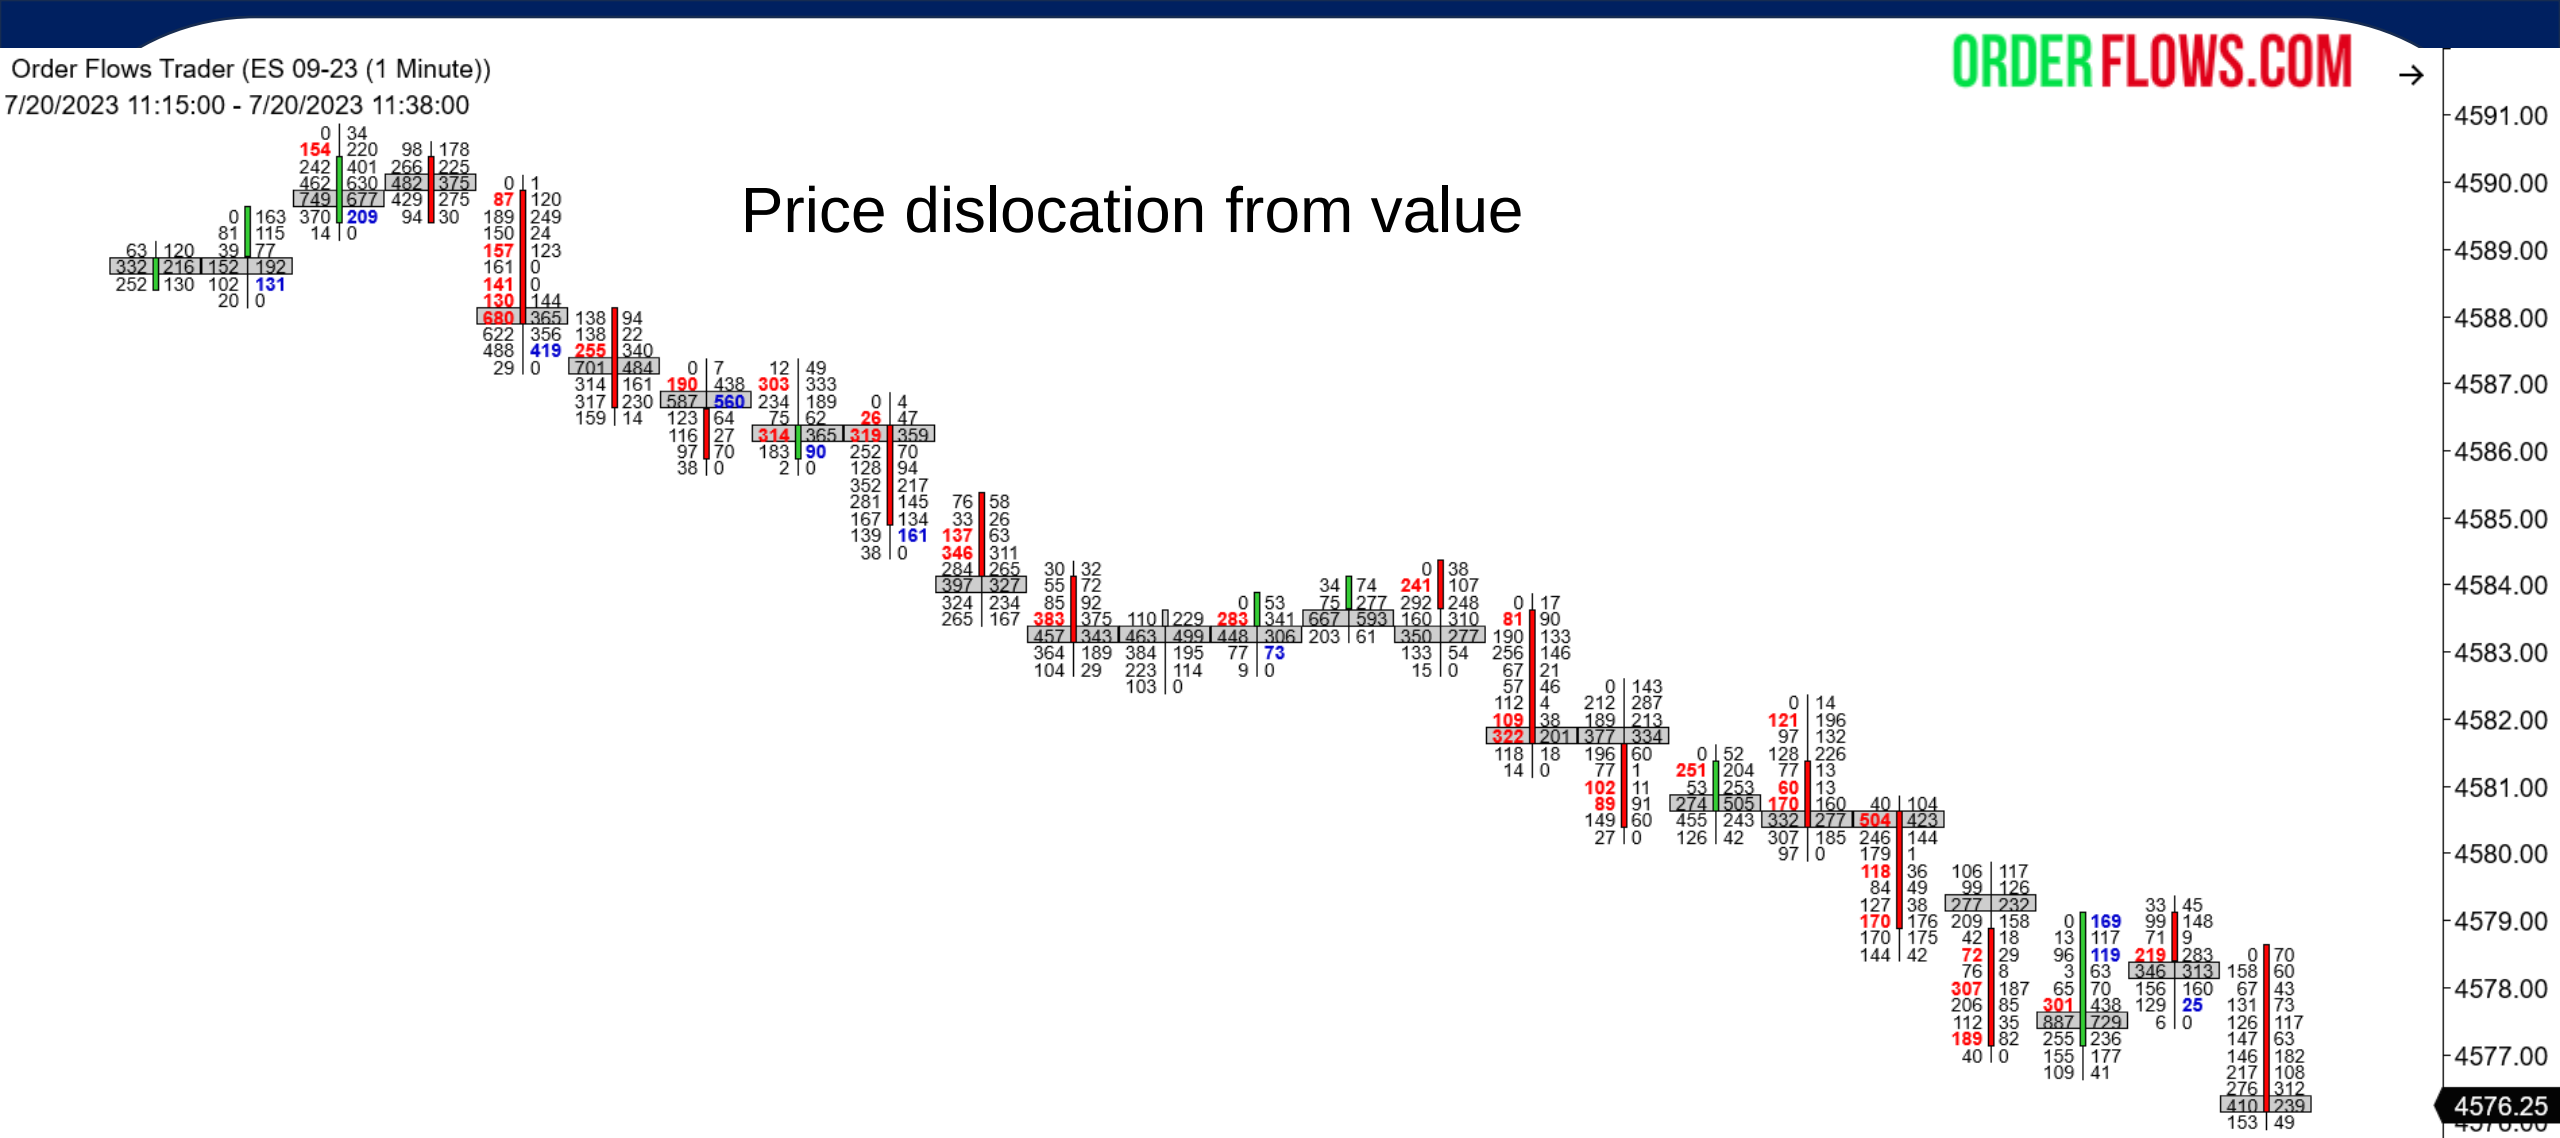

News/event driven chaos - Fundamental news events sparking volatile spikes as traders re-position.

When there are inefficiencies in the market, that is where trading opportunities arise. But not all inefficiencies are tradable. I would trade something like thin prints, but not a news event.

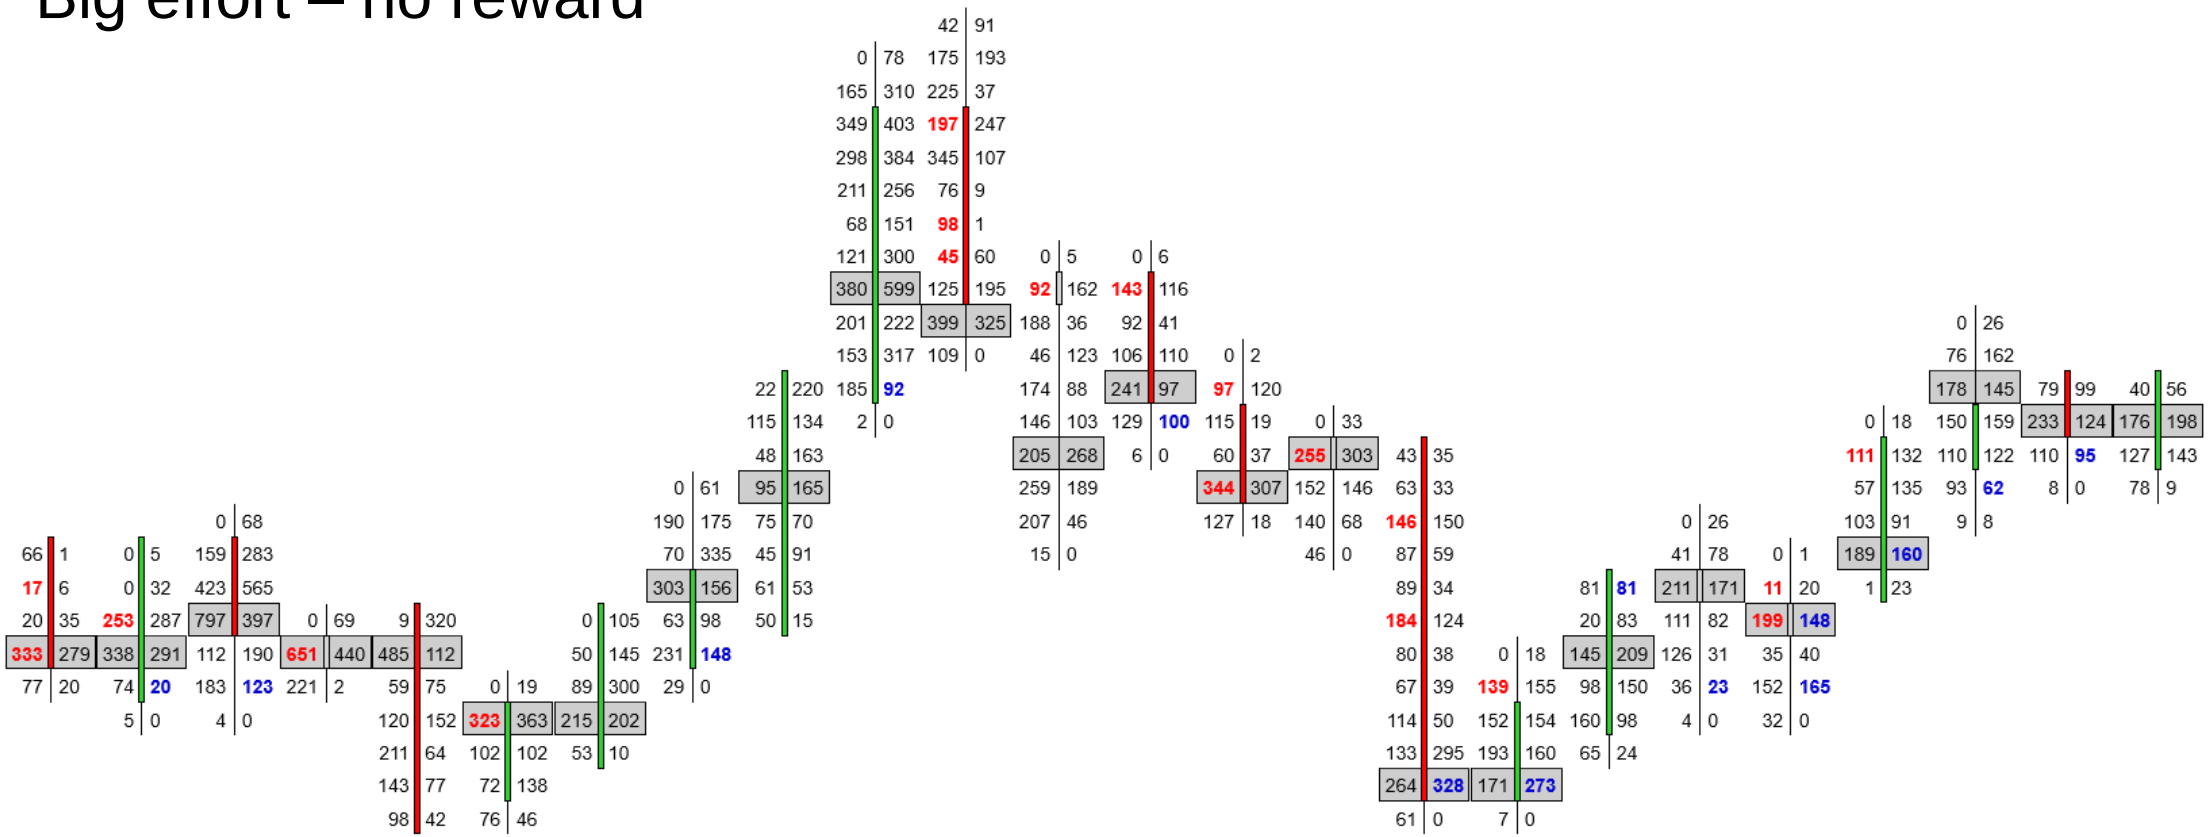

Inefficient markets exhibit what many traders consider noise but a lack of real conviction. Be patient trading these conditions using order flow, wait for clarity to emerge.

Effort refers to the volume and delta (difference between buying and selling volume) exerted by buyers and sellers. When a significant amount of effort is exerted without a substantial price response, it indicates potential control from the opposite side. Conversely, when price responds favorably to effort, it suggests control by the exerting party.

Stuck traders are individuals who find themselves in unfavorable positions as a result of stop runs. At market highs, stuck traders are typically those who continuously buy into the top, often driven by inexperienced traders or those expecting the trend to persist. Conversely, at market lows, stuck traders are usually short sellers who accumulate large short positions without being able to push the price any lower. They are looking for or trying to cause stop runs, but instead run out of ammunition.

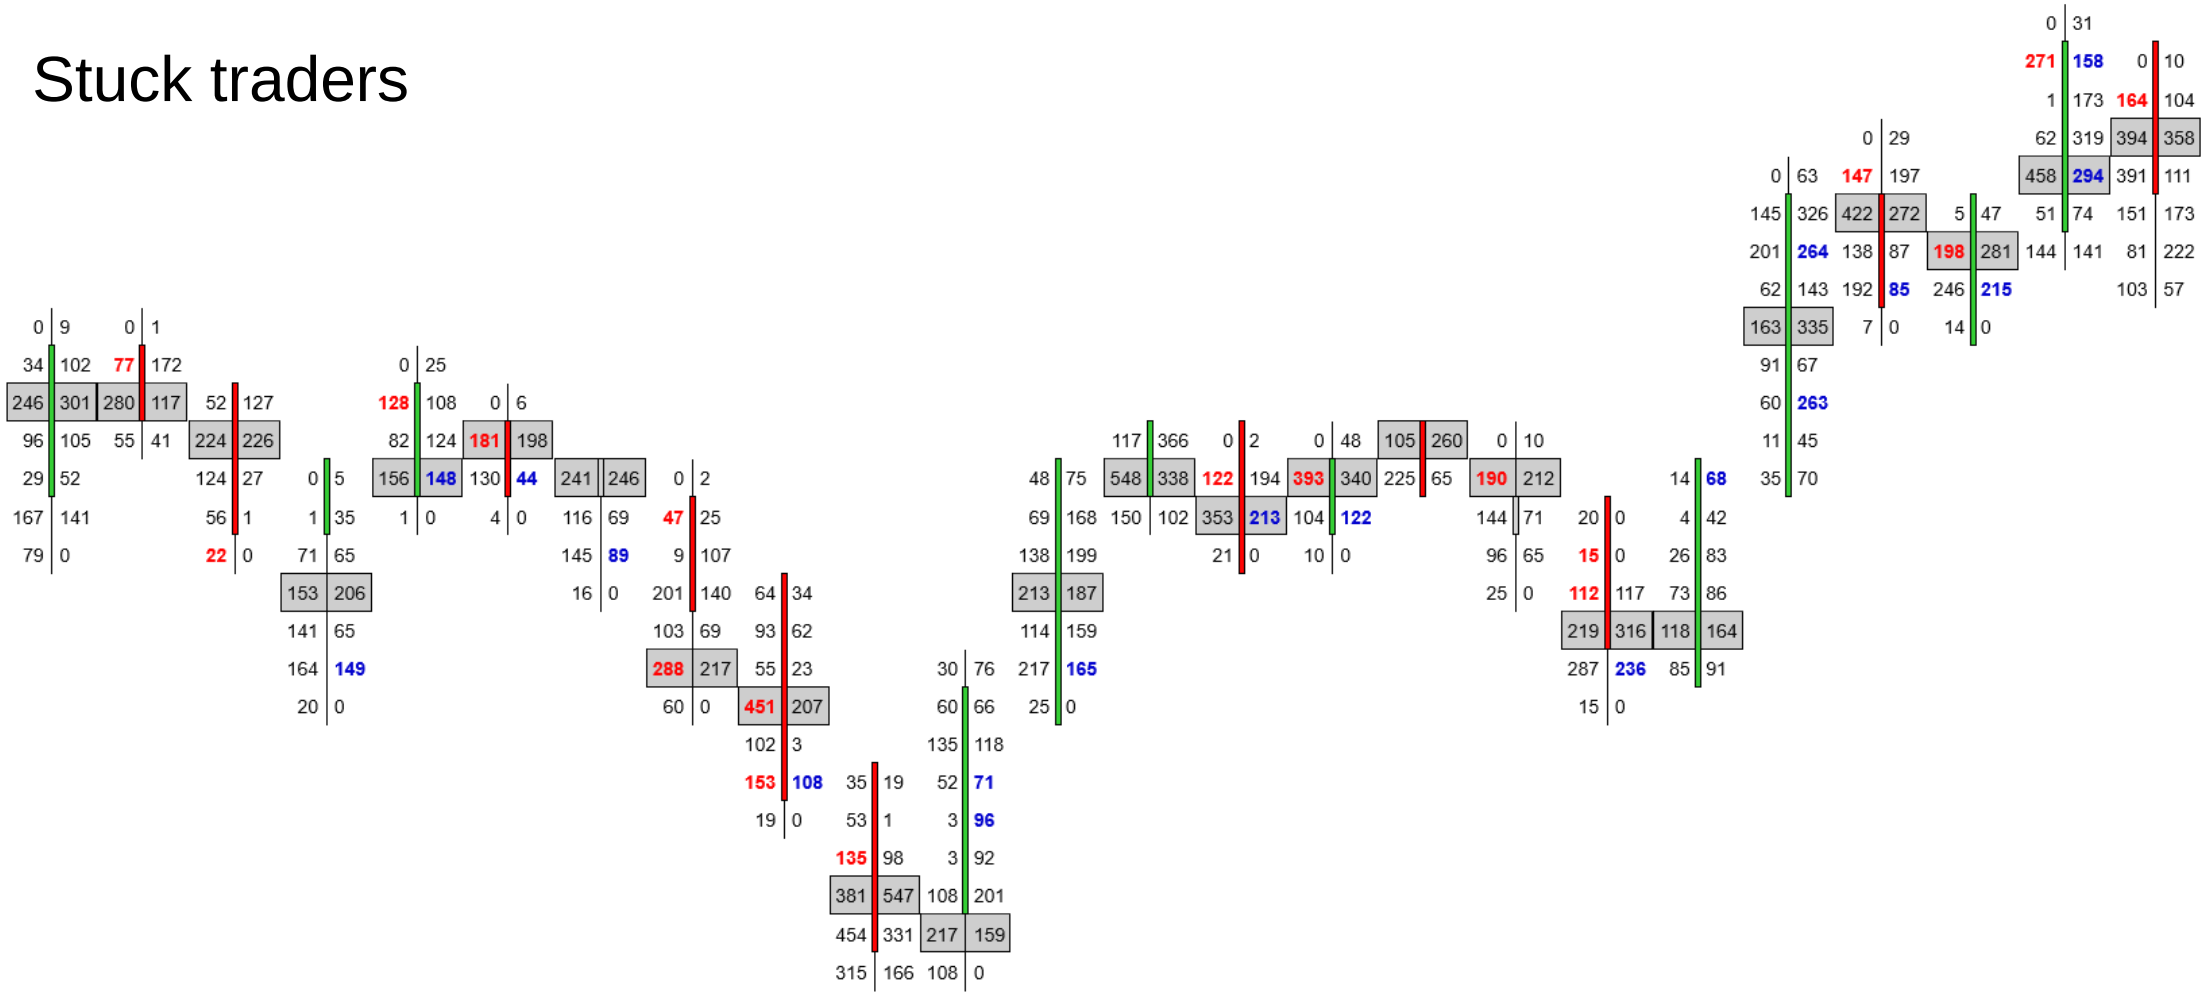

Stuck traders in a downward market rally continuously re-offer larger sell orders on the DOM, pushing prices lower, but a large sell order resulting in an uptick or flat line indicates a potential turnaround, while continuous re-offering to a certain point indicates heavy resistance and a potential reversal.

Intelligent traders take advantage of sellers who cannot press the price any lower, leading to a buy stop run and the entry of big buyers.

To identify potential reversals of stuck traders, traders need to watch for reactive buys or re-bids. Stuck shorts face problems when there is a strong re-bid from buyers to propel the price upward. Conversely, stuck longs get screwed when the re-offer from sellers to drive the price downward. By waiting for these reactive moves, traders can enter trades on the same side as the dominant market participants.

To take advantage of this strategy, traders should aim to enter trades in and around the area where stuck traders have accumulated.

Wait for confirmation of a re-bid or re-offer before entering the trade.

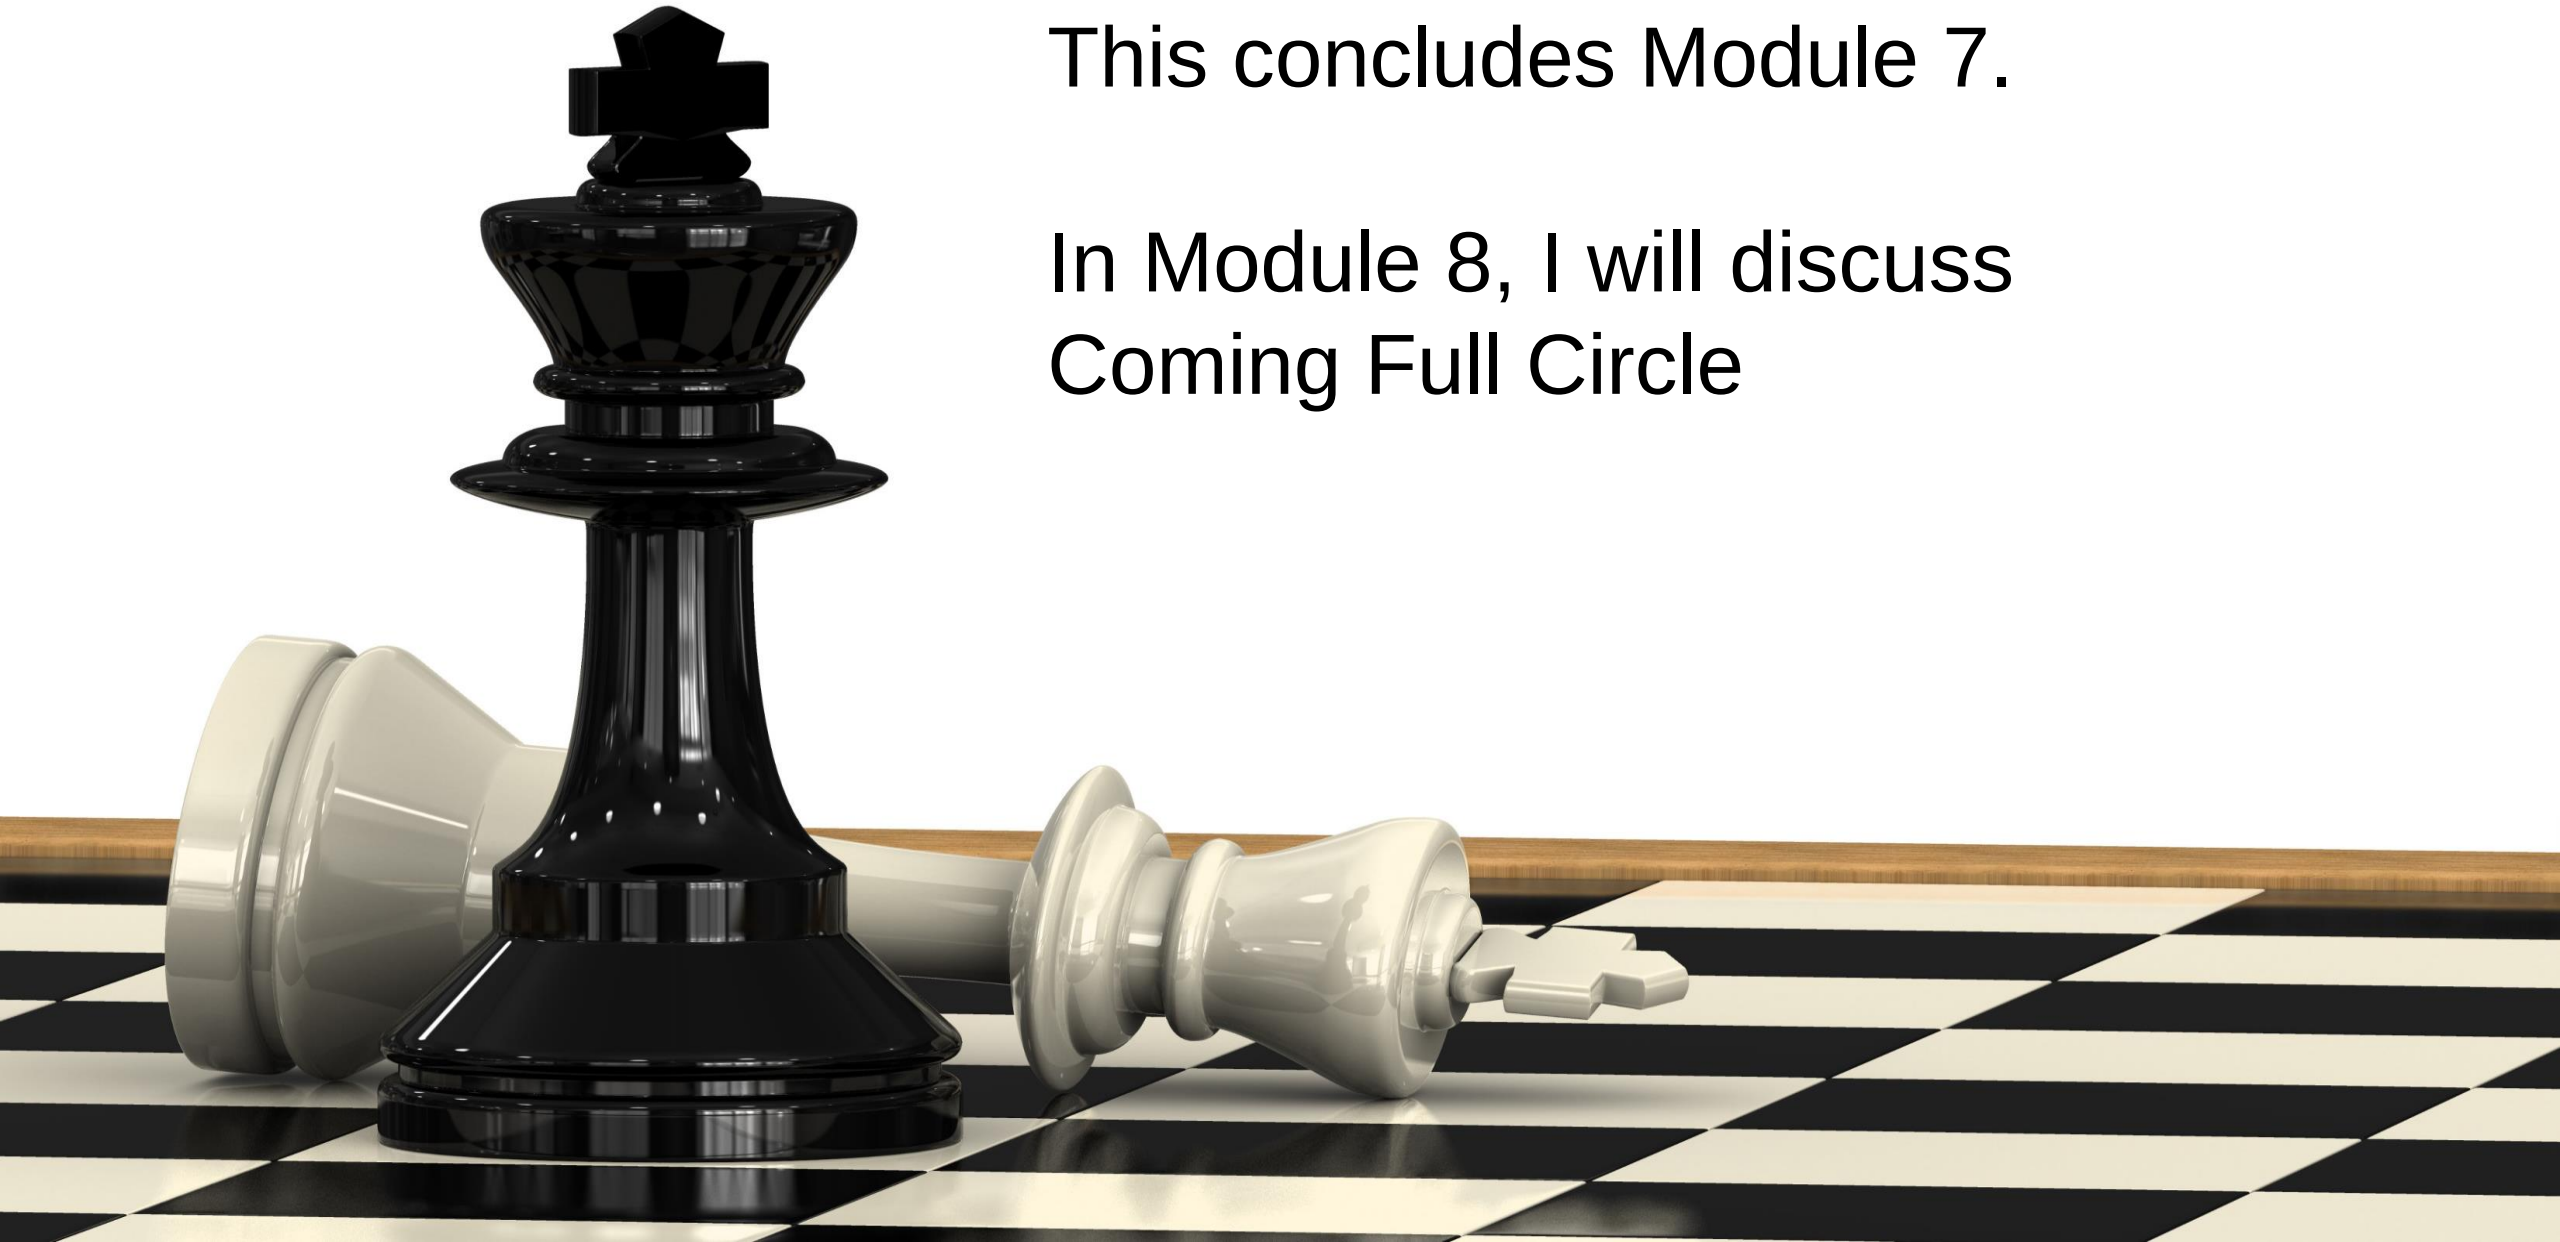

Traders can place their stop orders below the accumulation area, ensuring limited risk.

This strategy offers a low-risk entry point with the potential for significant price movement.

Stuck traders can become unstuck if the market moves against their position, so it is crucial to wait for confirmation before entering a trade.

Depending on the size of the bid or offer, traders can adjust their position size accordingly.

Smaller bid sizes may indicate a less substantial reversal, so smaller position sizes may be appropriate.

This concludes Module 7.

In Module 8, I will discuss
Coming Full Circle
